MATRIX 42

The Book of Truth that Changed the World

This is a story of how a young man figured out the secrets of the matrix and when he told the world what he had found... no one listened.

Animals

In the beginning on this small planet that we call Earth there was no life as we know it, only harsh conditions and some basic minerals, molecules, and elements. Our world was created by star explosions that released “star dust” which is just a mix of molecules, elements, and atomic particles. Most of this “cosmic dust” is comprised of hydrogen and decreases in the total number of elemental particles as the atomic mass of each particle increases. The heavier the element the less there is of it on this planet because it takes time and energy to combine the lighter elements into the larger and thus more complex elements inside of stars through the process of nuclear fusion. The elements that were drawn together due to accretion in space time didn’t have to be attracted to each other and coalesce into a ball of rock that we call Earth. These elements could have decided to repel each other and if that were the case, our universe would have been a large cloud of gas and murky “star dust” spreading evenly while getting less dense over time. This would have been a terrible place to start off at in terms of life because nothing would even happen. You might have a few atoms and elements come in contact with each other every once in a while but over time the connections and atomic “car wrecks” would happen less over time until the atoms were so far apart that the cold void of space would become so vast and cold that the movement and thus “life” in the universe would cease to exist. There would be an absolute zero asymptote where everything freezes and the vibrations that create our reality wouldn’t be able to survive and the universe would be dead as we know it.

The good news is our universe doesn’t work this way and atomic particles, elements, and “star dust” want to come together and create something new. Matter can be arranged in specific shapes that can be useful in creating all types of materials and tools for the human race. We can arrange atoms into a crystalline form and create some of the strongest, lightest and even blackest materials known to man thus far. Currently these materials that have specific atomic shapes and arrangements that give rise to advanced composites and useful materials like carbon fiber, kevlar polymers, Aerogel, and even Vanta black coatings. These materials are no more special than simple H₂O or diamonds at the nano level. They are just a special arrangement of atoms in a specific shape. When you arrange atoms into a pleasing shape that can be used for a specific

purpose efficiently you have brought a new tool into existence for the human race to use as they see fit. Humans have invented many of these special arrangements of atoms and elements and we have also been given some materials through both accidents and trade agreements with beings that aren't from this planet we call home aka Earth. Some of these extra special materials that humans have stumbled upon with otherworldly help are materials you would find useful for inter-dimensional or interplanetary travel. Have you ever wondered who the first person or organization that decided to send optical signals through a small piece of flexible glass aka fiber optical cables was? What about night vision optics that are able to magnify very small light inputs to augment the visual spectrum to see clearly in near pitch black darkness? How about stealth technology that has the ability to absorb or reflect electromagnetic waves to fool radar into thinking there is nothing in its field of view? How did we come up with the idea to store and process data through a silicon chip that would make calculations based on machine language which is just a long string of ones and zeros? When the light is on and sent down an optical cable to a computers CPU the computer reads a one and when the light turns off the computers CPU reads the lack of light (darkness) as a zero. I have spent thousands of hours researching these topics and have come to the conclusion based on numerous pieces of evidence and first hand expert testimony that these inventions were not imagined in some secret government underground base or university lab. These inventions that changed the world were all reverse engineered from crashed inter-dimensional or interplanetary transport ships that had catastrophic failures while in flight and crashed to the ground. These craft were quickly cleaned from the Earths surface and hidden away in a government base to be studied and the technology used for the advancement of the military industrial complex and kept secret to make a profit by building weapons instead of giving the technology to the people of earth who could have used it to make the world a better place.

The military industrial complex has funneled hundreds of billions of dollars each year and trillions of dollars over time to "black projects" that are done behind closed doors and usually underground and not on the official accounting documents stored at the pentagon in Washington DC. We know about many of these projects because some have been declassified and others have had leaks and documentation to lead a reasonable person to conclude that the technology exists and is owned by the United States government. There are even other projects that have

been kept so secret from humanity that even talking about their existence can become a reason for “black helicopters” and “black SUVs” to follow your every move on this planet.

Now getting back to the subject of where these technologies have originated from we can begin to dig a little deeper into the reason this chapter is called “Animals”. The historical data suggests that humanity was very likely a product of a superior race of beings that decided to create humanity as a tool to do their bidding. Let’s look back at the some of the most unique and oldest forms of writing that date back nearly 5,000 years ago from ancient the Sumerian civilization (present day Iraq) called cuneiform script. This advanced form of writing is done with a slanted pick into clay and the writing is three dimensional meaning the script is written into the face of the tablet and also into the depth of the tablet. These ancient tablets cover a wide array of topics but the one topic I have found to be the most intriguing covers the beginning of humanity as a species. These cuneiform tablets tell a story about how the creator gods came from their planet millions of years ago and started to mine the Earth of its natural resources. These gods seemed to have a need for the element we call gold for the purpose of health and bodily rejuvenation. I believe they were using a special type of elemental gold scientists would call “monotonic” gold. This type of gold has a single atom and because it’s only one atom it doesn’t look shiny or have a yellowish color like the gold we use for rings and in electronics today. The gold that we call yellow or white or even rose in color is actually 2 gold atoms combined together at the atomic level and then when you add these dual atoms into massive balls... you get a gold spec in a pan near a river. When you add up a bunch of specs from the pan you get a golden nugget and when you shape and mold the nugget or a bunch of nuggets together you can end up with a nice piece of jewelry or maybe an efficient electronic connector in an iPhone or headphone jack. However, the monotonic gold that these ancient beings called the Anunnaki were interested in is actually near pure white in color and doesn’t clump into balls or nuggets. Monotonic gold is a powder and looks similar to a pile of wheat flour used for baking and the ancient beings would use this powder because of its healing properties for the body and possibly their planets atmosphere and environment. It’s possible that this monotone gold powder was ingested and had healing properties similar to how pomegranate juice can bind to and eradicate free radicals from the human body today.

After a long time of mining the Earth for valuable elements these gods decided to create their own robotic helpers to mine, provide scale and allow the gods to focus on other tasks. The

ancient tablets don't actually say these gods created robotic organisms but I believe we are all a form of "digital" being and I plan on explaining this in more detail to tie everything together throughout this book. Anyway, these beings created humans in their image to help them mine for gold and over time decided to upgrade the human race with larger brains and more advanced skills. I believe that these ancient gods decided to build their new project called "humanity" off of a preexisting model that had already evolved on this planet called chimpanzees and the great apes. Did you know that we "humans" share about 98.5% of our DNA with chimpanzees? If that 1.5% difference in our DNA genome is the difference between a chimp communicating using sign language and humans building the Hubble Space telescope, can you imagine what what an extra-terrestrial being that was 98.5% human but had an extra 1.5% of their own DNA would be capable of? We "humans" would be like chimps compared to this race of extraterrestrial beings that had just 1.5% different DNA in the same direction as our advanced human DNA is from the common chimpanzee DNA.

Most likely these advanced beings would be able to use their own minds more efficiently and may be able to communicate via telepathy and read your thoughts and emotions at a distance. They may be able to live much longer than humans and may be able to travel freely from planet to planet, galaxy to galaxy, or even travel into and out of different dimensions. Is it such a hard theory to believe that an advanced race of beings created humans simply because they could? Meaning they had the skills ability and technology to reverse engineer DNA and form it into a new string that resembled their looks and over time decided to wipe out their creation with natural disasters, plagues and disease and then start over with a newer model of their creation called "humanity"? As humans, we have the ability now and have had the scientific ability to create clones of animals and even design human babies through DNA splicing and sequencing with the help of the new CRISPR technology. Is it possible that an advanced race of beings created humans and gave us the ability to create fire, the wheel, written language, irrigation, tools, machines, technology, planes, trains, autonomous driving vehicles, space transport ships, geosynchronous communications satellites and the Hubble space telescope? I believe and the historical evidence support the fact that humanity was created and has been given guidance and help along the way to achieve many of the advances we see today that the chimpanzees haven't been able to accomplish in their evolutionary timeline yet.

Let's move down this rabbit hole we call the evolution or creation of the human race and how our DNA is what makes us so special. Let's talk about what our DNA is and how something so small can be so powerful. DNA (deoxyribonucleic acid) is a simple string or combination of biopolymer strands that can be arranged in a single helix pattern (RNA) or a double helix pattern (DNA). There are a total of four nucleobases (Adenine, Guanine, Thymine, Cytosine) and they always have a matching partner. Adenine always connects to Guanine and Thymine always connects to Cytosine. If you have a piece of RNA with three peptides in a row like (A|C|T) you would know the matching partners of the full double helix DNA strand to be (G|T|C). The complete full string would be (A-G|C-T|T-C) where you can always take the left side of the DNA double helix and know what the matching piece of RNA from the right side in a single helix would be. Let's compare the first strand of RNA (A|C|T) to a computer code and let's add in one more row of Guanine (G) to give us one of each variable in our new string. We can think of this new strand of RNA as (A|C|T|G) and the matching piece of double helix DNA is (A-G|C-T|T-C|G-C) in the form of a machine language computer code comprised of zeros and ones. The issue we face when trying to substitute (A|C|T|G) for the ones and zeros of machine language is we have an unequal amount of variables so we need to think of a way to still use the ones and zeros but have a unique way to represent this. I believe that using quantum theory and the principle of superposition to denote the spin or position of the (A|C|T|G) variable would be a sufficient way to translate this to a basic machine language of ones and zeros. If we decided to give all the Adenines and Guanines a value of one and the Thymine and Cytosines a value of zero we would have an incomplete key like this (1|1|0|0) where we can't tell if the 1 is a Adenine or Guanine or the 0 is a Thymine or Cytosine. However, if we add in a second variable to denote what type of peptide base we are looking at with a second notation for spin or position, we can start to solve the code we are looking at creating or reverse engineering.

For example (A|C|T|G) in machine language and notated with spin or position would be (1^|1*|0^|0*) where we can now translate the ones and zeros into a code that could be run in series through a CPU as simple binary code. We also have a second binary code emerge that can also be run through a CPU if properly formatted. We now have a base level code of (1.1.0.0) and a second level code of (^.*.^.*) if we decide to substitute the ^ for a 1 and the * for a 0 we arrive at the code (1.0.1.0) and can combine or overlay the first level code as we see fit for analysis. We can now see a new code that looks similar to (11.10.01.00) where we can use the

first number of our pairs to decipher if the peptide we are looking at is on the left or right side (side 1 or side 2) of the DNA double helix. The helix structure of the DNA molecule provides great strength but in reality the single strand of RNA is what carries the genetic code that can be easily replicated. Now that we can convert the peptides into a language that can be analyzed inside of a computer we can start to think about how this code can be best utilized to carry information over time. If you look at a string of bulb holiday lights and there are only two wires carrying the electrical current in series you know that if a single bulb gets broken the whole string of lights will go out until a replacement bulb is inserted. However, if your string of lights has three or more wires going the length of the string you know that if a single bulb gets broken or burned out the rest of the lights will continue glowing because there is a parallel way to get current to the other lights. I believe that DNA and RNA function similar to the parallel string of holiday lights where the peptides are in a parallel structure where you can still manage to function with or without some of your genetic pairs turned on or off. If you have a parallel string of lights and a small control unit you can even make the lights turn on or off depending on the direction and flow of electrons down each wire and make the lights twinkle or dance to the tone of a musical beat so why would DNA or RNA be any different?

Balance

What is balance and how can this idea be applied to the theory of life and being able to thrive at both a macro and micro scale? This topic of balance can go in so many different directions because it could mean something different to each person. I'll try to give a few analogies in this chapter to supplement my views on this subject. When you hear the word balance you may think of standing on one foot or doing yoga or maybe even the ancient act of using paper and pencil to "balance" a checkbook or maybe the energy flow that goes through all things similar to the force in "Star Wars" and although these are all in fact a form of balance I want to focus on the latter example for this chapter. My view of balance is very similar to the yin

yang and its ability to counter act itself to achieve a unique representation of both duality and infinity. The white and black shapes seem to be both the top and bottom, left and right, up and down, beginning and end and all of this is happening at the same time inside of a picture that's written in two dimensions on a flat sheet of paper or maybe a rug or sticker or textile. Let's take this yin yang picture in two dimensions and begin to spin it around its axis in any direction. You would get a 3D spherical object that has an internal sphere comprised of a light and dark tube constantly eating itself in perfect harmony. As the dark tube eats the tail of the light tube the light tube does the same to the dark. Imagine a white colored worm that is walking to the left and always eating a black worms tail and the black worm is always heading to the right while eating a white worms tail. These weird worms constantly walk around the 3D object that they live on and never see each others face but always see each others tail. These worms on the surface of the Earth continue to eat each others tail and the sunrise and sunset above each of them continues to travel at their same speed in reference to how fast they can walk and eat each others tail. One worm gets to see a constant sunrise as the other sees a constant sunset and they never get to see the others beautiful start to a day or finish depending on which shift they work at. We can imagine the worms as being the small dots on the yin yang near the center and the left side of the sun or sunrise to the right side of the sun and sunset. As one worm walks on the 3D object, let's call it Earth in this example, and eats the others tail the sun follows at the same speed in terms of frame of reference for each worm. You can easily be an ant on the surface of the Earth standing on one spot and tell what time of day it is in your frame of reference by looking at what part of the worm and color of worm is near your ant hill or or can look at the position of the sun or lack there of or sunrise or sunset to calculate what is going to happen next in this continuous cycle. When I think of this example I can see balance from all angles and multiple dimensions.

For example you have two happy worms who are well fed and have great views of their favorite part of the sky. Each worm is both equal but opposite but if you remove the worms and place them 180 degrees in the opposite direction the balance is now gone because the worms are still well fed but they are no longer satisfied with the view they have. Maybe they like the new view better but are now sad because they are now scared to possibly go back to their old view or maybe they just don't like the new view. Something in their world has changed and they may now know that the sunrise is a sunset or that the left is now the right or the up is now down.

Either way you look at it the worms balance with their sunrise or sunset is now broken and it could be at the expense of the worms new external perception or internal visualization of the world it once had. The sun didn't change position in reference to the ant but the worm is now heading the opposite direction. Should the ant trust the sun as being the true teller of cosmic time or should he believe that the worm which is clearly on the same level and surface as the ant and not decide to tell the ant he would be magically deciding to move sideways over his hill without a trace while he was sleeping. Would it not be more probable for the ant to believe that the sun and skies above the ant hill decided to start going the other direction while he was sleeping? The ant can not be sure what is real because the balance has been removed from his frame of reference as well. The only one in this example that can truly be sure of what happened would be the sun that is always watching and if trusted by both parties could explain to the worms and ant that a specific variable was changed and the true cosmic time had not been changed and that the worms only looked like they had switched directions because the sun decided to shine a new wave length of starlight. The change in the starlight frequency gave the appearance that the sunrise was like the sunset and the sunset looked similar to the sunrise. The ant who remembered seeing the dark colored worm going to the left was now seeing the same worm in a shade of white going to the right. In order to have balance you must have a trusted party and a way to explain both size, shape, direction, and time.

You can see images and signs of balance in all forms of nature like the branches of the trees in winter looking similar to the roots if you could see through the dirt, but not during the summer. However, as each new branch grows above during the spring and summer, the roots grow in a similar fashion but in alternate seasons. The roots can tell what time of year it is even though they can't see the sun because they can feel the leaves changing and falling off the trees in the fall season. The trees can feel the sun even though they can't see it with eyes. The light of the sun warms the plant and the plant uses the light for photosynthesis and combining the water from the roots with the sunlight in the sky and carbon in the atmosphere to create new buds, flowers, fruits, stems, branches, limbs, tree trunks and even oxygen for the animals to breathe. The sun is the next scale up from humanity and is our cosmic timekeeper that can be used to explain how events unfold on this 3D object we call Earth. Balance is when there is enough sunlight being produced to feed the plants and the plants are happy enough to produce oxygen for the animals to grow healthy and strong. The animals have to be able to thrive and learn and

grow and finally produce tools and technology to make their lives easier. With great advancements in technology and the ability to scale these technologies we must ensure we are scaling the technology that help create more oxygen and allow more of the sunlight to be captured by both plants and the animals we are today that fight over energy.

I believe that energy should be freely available and can be accessed from the sun in an effective manner and even from an invisible but infinite supply of energy at the zero point or cosmic scale that you could call fractal energy.

This energy is all around us and could be similar to the force in “Star Wars” and this energy field is what I believe holds the universe together similar to the scaffolding you place around a tall building when it’s under construction. You need to have a mold or frame that has minimal support so that the building can be constructed vertically above the foundational footprint on a scenic city block and the scaffolding framework allows workers to construct the steel pillars from the bottom with ladders and top with cranes and even the outside with external scaffolding and inside with folding ladders. After the steel frame and floors have been established inside of the building the framers and artists come inside to lay the carpets, furniture, security systems, and decorations. Finally, after the building is complete the humans take over the square footage by signing contracts with the investors who had the building commissioned and built and they work or live like bees inside of a massive hive on Madison Avenue or Times Square. The cranes and ladders are now a remnant of what was once inside and above each floor for only a short period of time compared to the total expected lifetime for the building itself. In fact the building is designed to out last every human that worked to build it or ever moved into the building to work or live when it was fresh and new. With proper maintenance this building could stand for a millennia if proper materials were sourced and the regular maintenance was implemented over the course of the buildings useful lifetime.

Just as the scaffolding allows the builders to create the steel frame of the building the cosmic framework that can be seen only in the absence of visible matter and the intersection of the prime number fractal sequence. For example is you look at the Fibonacci sequence and the pattern that emerges from its limits as you increase or decrease the value and range of your inputs to the equation. This patterns begins to show that there are levels of scaffolding throughout the universe that you can also see in the prime numbers and also in the value of “e”, log, Pi, the Pythagorean theorem and even the golden ratio. When you look at the old hidden

3D pictures from the newspaper you can only see the image within the image because of the absence of the internal shape inside the external picture. This means there is no real outline or structure to the internal shape or object but there is a pattern that can show the visible presence of the object if your eyes focus on the difference between the background pattern inside the picture compared to the background pattern of the internal hidden object.

I believe that the balance in the world that we can't see directly but can see in the overall system is simply the fractal code or scaffolding to our universal realm that is hidden in plain sight. It's right in front of everyone but it's also impossible to see when you are looking directly at it. You have to be able to remove yourself from the equation and stop your eyes from looking for the pattern in order to see the pattern without focusing on it again because once you do it will fade away at the same speed you try to focus in on it.

I believe that there are many ways to harness this energy by building machines that have a specific shape and are aligned in the correct proportions and direction to harness this invisible energy and use it to move magnets around coiled wire to create useful magnetic fields and an abundance of clean electromagnetic energy. Balance is the real key to the universe that allows everything to come into being and also be removed from the overall system in a manner that serves both a purpose at the smallest and largest of atomic or cosmic scales.

CIA

This is a strange chapter for me to write because it feels wrong and kind of dangerous to write about this branch of the United States government but since many others have done the same before me I guess I'm in the clear to choose my words wisely. I've never worked for the CIA or even been to Langley Virginia and I've only visited our nations capital for a high school trip in 2004 for the National Science Quiz Bowl where you answer questions while trying to beat the other team in reference to pressing a button the fastest and also having the correct answer to the specific science question asked. We had an exceptionally gifted person on our Niceville High

School team named Ibrahim and he was considered at the time one of Microsoft's highest achievers, smartest 40 under 20 or something like that. He was able to answer pretty much every question asked and was usually the fastest person to the buzzer as well for all different types of subjects like mathematics, physics, and chemistry. I'm not sure what ever happened to Ibrahim because he graduated a year before I did and he may work for the CIA now for all I know. He was darn sure smart enough to go to any school and be anything he wanted to be. I chose a different path or maybe another path chose me to bring me swirling around on a twisting trail through highs and lows and culminating with the CIA following me as I travel on planes to try and figure out my life and where it's guiding me. Let's start with the fact that my grandfather was a Colonel at Eglin Air Force Base near Fort Walton Beach, FL and was in command of the Air Force Armament Engineering lab that designed and tested smart cluster bombs to special detonation fuses and even the Vulcan cannon mounted under the pilots seat of the A10 Warthog attack plane. BBrrrp BBrrrp. During high school I completed an internship for an aerospace company based in Crestview, FL that was currently installing the DIRCM on Air Force and National Guard helicopters and aircraft. DIRCM stands for "Directed Infrared Counter Measures" and were basically sophisticated laser systems that could identify surface to air and air to air missile threats and neutralize them. These laser systems could shoot the targeting portion of the incoming missile and cause it to lose its guided tracking system and miss its target and thus save the lives of all on board the aircraft. This aerospace company would also take older Boeing C-130 cargo aircraft and completely disassemble them in order to rebuild them back into the awesomely powerful AC-130 which is the "Attack" C-130. This "Spooky" aircraft carriers cannons and rotating barrel machine guns and has the interior filled with large brass and titanium munitions inside of steel racks instead of the large elephants or jeeps that would be slid out the back of the opened mouth and clamshell like tail that can swallow and regurgitate both while in air or on land. I was even able to sit in on a board meeting where they were planing to build out a C-130 with a large chemical laser setup in the back that would mix ingredients to light a large and very powerful particle beam that could be expressed from the aircrafts optical laser sighting and positioning system that looked similar to a multicolored mirrored eyeball of a large metallic dragon. I was only able to see and hear about this upcoming project from inside of a short board meeting that my co intern and friend were able to sit it on.

However, we were able to walk around the aerospace facility and see the planes and helicopters being stripped and rebuilt to become awesome and shiny or black and stealthy as they once were or upgraded to become. I even remember there being a large hanger that was off limits to almost everyone that worked at this aerospace facility and even had its own private security that monitored the openings to this hanger with armed guards and special uniforms. There was an extra layer of security given to this special hanger and I wondered why. We were told “off the record” by the employees that worked there that “The CIA owns that hanger and it doesn’t exist”. The employees were told that they couldn’t even acknowledge what was inside the hanger but over the next few months my co-intern and friend finally learned the truth from an older employee who had been at the facility for a long time. This employee told us that there was a white C-130 inside the hanger that the CIA would use for covert operations and usually only took off and landed at night when everyone else had gone home. This did turn out to be true and the plane has some great pictures online and was used to transport materials such as cocaine from South America in exchange for guns during the Iran Contra operation. I later found out that at the time I was doing my internship at this aerospace company in 2004-2005 this white C-130 was being used for “extraordinary rendition” flights across the world. An extraordinary rendition flight is when a government agency basically captures a human being from somewhere in the world and whisks them away for interrogation at a “black site” which is a secret prison to extract information from a subject or target usually against their will.

Deep Dive

What’s the deepest dive a human can experience? Would it be a free diver who can dive hundreds of meters below the surface of the ocean on a single breath? Would you consider a HALO (High Altitude Low Opening) skydiving jump that an elite special forces operator or Navy SEAL may complete possibly behind enemy lines? Maybe the deepest dive of all would be inside

of a dream world similar to the movie titled “Inception” were an agent or operator could enter a dream world within another dream world and at each level the dream world becomes more fragile? I would consider the last possibility as being the deepest dive of all because there is no way to tell how far down you’ve gone or when you’re supposed to return to the surface for a fresh breath of air or open your parachute to avoid the immediate deceleration when impacting the ground that may result in death or serious injury. Remember it isn’t the fall that kills you, it’s the rapid deceleration that rearranges your internal organs and crushes your bones into remnants of their previous shape and structure.

I believe that the ultimate deep dive is into the mind and would most likely be your own mind but with the right materials and biological communication devices could be another persons mind other than your own. Science today has the ability to read your thoughts and use those specific brain waves to control mechanical apparatuses connected to the human body or even transmitted brain wave signals to an external device such as a drone or similar robotic device. People that have missing limbs are now able to wear prosthetics that are fully controlled by their thoughts and can even open doors or grasp a raw egg without crushing it. I remember that I once visited the “Wonderworks” museum in Orlando Florida and there was a game where you and a partner could put on a rudimentary headset that would measure your brain waves and would increase or decrease the electrical current on the train tracks inside a glass enclosure between you and your “Mind Game” partner. The goal of the game was to be able to use your brain waves to move a metal ball from the center of the enclosure to the other side similar to an air hockey or foosball game. If you were able to settle your mind you could find the right way to harmonize your brain waves so that the ball would move forward and there was a screen to show your brain waves in realtime so you could make adjustments. In this specific game I actually beat my opponent which was my girlfriend at the time and I still remember how upset she become after speaking so confidently that she was going to win as the employee strapped the brain wave receivers onto each of our heads.

I’m still amazed at the power of the brain and I fully believe that our minds can and do create our own reality. I believe that if you can learn to control your mind you will also be able to control almost every other aspect of life. The mind is the ultimate authority over your happiness, health, emotional stability, relationships, time management, and even how we perceive and react to time itself. If you’re able to fully control the way your mind perceives reality you can

essentially put yourself in a cocoon of happiness even as the walls of your world are crashing down around you similar to the hypnotic trance that Peter Gibbons (Ron Livingston) experiences in the movie “Office Space”. With complete authority over your own mind you would be able to not only control your perception of the world around you which is considered by most to be reality but you may very well be able to build the world around you and create your own reality. It’s very possible that the reality each one of us experiences is a creation from our mind that also interacts with the reality created by others minds in our immediate location. Not only could our minds literally be creating our own reality each day but we could also be mixing our realities with our friends and neighbors and possibly even our ancestors or people who live on the other side of the world that we have never even met in person.

Is it so irrational to think that the world we experience is simply a reality that is partially or completely constructed in our mind? Could we all be experiencing reality as a mixture of the wants and needs that each of us has inside our mind and the universe must be the mediator that has to choose who gets what because everyone can’t have everything they want at all times. Does this mean that a single person in isolation with only their mind to create their reality would have ultimate control because the universe wouldn’t have to choose sides? Could a single person be the key to their own universe where they are the ultimate decision maker that can decide to build an internal mind matrix of happiness or pain depending on their perception of the reality they want to experience? I believe that we can make our own world when we are alone but when we start to interact with other conscious beings the universe must split the difference in the event that the wants and needs each being has inside their mind aren’t equal or congruent with the laws of nature inside this dual or multiple reality. When there are multiple minds creating their own reality inside of the same universal location or space such as Earth the universe and the cosmic laws must try to give each participant their desired outcome as long as the outcomes don’t contradict each other.

Energy

Energy is such a wonderful topic and it's unique in the fact that it pretty much rules the world. The only thing that can be bigger than energy is vibrational frequency that can literally trump anything to materialize into matter or energy at a specific point in space and time in reference to humans, elephants, worms or ants. We will arrive at the topic of frequency in the next chapter so let's try to and remain focused on the specific topic of energy for now and how energy can be used to benefit humanity as a species.

When you hear the word "Energy" what do you generally think about? You might think about the energy in the human body or lack thereof in reference to exercise or maybe the explosive power of a thermonuclear warhead when it's detonated in the desert or near an island atoll or maybe over a city in Japan. There are so many ways to think about how energy on both the micro level or the macro level has changed the course of our normal daily routine or even the advancement of the human race as a whole. I want to focus this chapter on how energy is currently used on this planet in between the most personal and most macro scales that I talked about earlier.

Let's look at energy in the form of its potential to make an object move or create sound or heat in the form of light. These are all very useful forms of energy that we currently try to harness from many different outputs such as sunlight, potential and kinetic motion, or even potential energy stored in the form of hydrocarbons in fossil fuels. As humans we have invented ways to harness the energy from the sun's light by creating panels of silica that can capture electrons that strike the panel when the sun shines above it. We have the ability to capture the movement of water from streams or waves from the ocean and convert that kinetic energy into another form of energy like potential energy that can be stored for later use. We have the ability to use many different forms of energy to spin a magnet around a coil of wire to convert kinetic energy into electrical energy. Sometimes we use water to spin this magnet like at the Hoover Dam in Nevada and other times we use steam to spin our magnets connected to a turbine to create electricity. We can heat water with the potential energy from fossil fuels or we can use the radioactive heating inside of a nuclear power generation station to create steam to spin our magnets and thus create electrical energy to be sold and used by the masses.

I propose we start to look into the potential energy availability from alternate sources of power generation such as zero-point energy. Zero point energy is a unique topic for discussion because there is relatively little actual science on the subject and the scientific experiments that try to build knowledge around this topic are generally underfunded and designed to prove the impossibility of these techniques rather than their possibility and actual future use in our society. We humans find it much more profitable to dig up fossil fuels and burn these hydrocarbons or capture the sunlight or motion of the waves because it can be easily accounted for and thus billed to the public that uses this energy. However, what if energy wasn't limited and the only reason we still use these archaic forms of energy is so that some people at the top of our financial pyramid can profit from the use of harmful elements and radioactive isotopes? There are numerous ways to generate energy from the environment around us in the form of zero point energy. I firmly believe that the existence of UFOs or UAPs (Unidentified Ariel Phenomena) are a highly guarded secret on this planet for the sole purpose of keeping their energy and propulsion systems a secret and out of public debate. For example if a round interplanetary spaceship landed on the White House lawn and the US government was forced to explain to the public that this device was real and had in fact come from another planet or galaxy, people would start asking questions about it. People may ask things like "How did they get here?" "Do they use solid or liquid fuel like our current rockets?" "How long did it take them to get here?" and the government doesn't want to have to explain these answers even though they have known the answers to these questions for over 70 years. These interplanetary and possibly even inter-dimensional transport ships do not use solid or liquid fuel like we do to push ourselves with thrust like a rocket or jet engine. These round and sometimes cigar shaped craft use what's called zero point energy to transport themselves at nearly infinite speed and most likely can manipulate linear time. These UFOs or UAPs have the ability to tie into the geometric structure of our universe and harness the energy that exists at the most basic level of our fractal universe. The same power systems on these craft must be designed as a specific shape and also at specific proportions to allow their power systems to harness this energy that gives rise to matter, energy and time in our dimension. These beings have the technological know how to extrapolate unlimited energy requirements from the zero point field that gives rise to all things inside of our dimension such as time, matter, and energy and the connection between all three. When you have access and the authority to manipulate the zero point field of spacetime you can make

adjustments to anything and use energy to manifest matter at a specific time in reference to space.

Frequency

Frequency is simply the amount of energy and timing between waves and can be illustrated in the ocean waves crashing on shore or on the heart monitor in a hospital or even through the speakers in a car or at a concert. The sound waves that are created from a speaker can also be combined and harnessed to form physical structures in our dimension and thus give rise to matter and the building blocks of our lives. It's possible to send a specific sound frequency down a wire and out of a speaker and into a physical shape for example a square and then increase or decrease the frequency and the resulting wave will give rise to ornate structures on a two dimensional plane. This specific type of sound to visual representation is called "Cymatics" and could lead us as a civilization to understand that underneath all of the physical matter we see in front of us each day is simply a frequency and wave pattern that has manifested in our reality in the form of an atom, molecule, shape, object, or series of useful objects that have been interconnected into a system such as a watch, computer, or autonomous vehicle.

When you have the ability to generate a sound frequency and also capture that frequency in a specific container such as a 2D square you can modify the resulting frequency to manifest the shapes you want and then form a material structure out of those shapes. This means that if you have the ability to capture sound inside of a special container you would thus have the ability to use these sound waves to create single layers of 2D shapes and possibly even set those shapes permanently with a cosmic glue. This may be hard to think about for the moment but let's move on down this analogy to see if we can make some more sense of this topic. A 3D printer uses a liquid material to print 2D layers on a 2D plane and after the entire layer is solidified the printer moves up in the 3D plane to print another layer on top of the previous layers. Exactly how this

printer can easily map a 2D layer in liquid form and thus wait for the liquid to solidify there is a very high likelihood that a similar process could be used to create 3D objects by layering and solidifying sound waves and fine particles that fill the shape of the sound waves we have manifested. If you have an advanced ability to use sound to form a shape then you could add a solidifying ingredient to each 2D layer and thus build a 3D object over time by adding new layers. Since we live in a 3D environment we can use sound to build objects the same way that we build 3D objects with 3D printers which is a large stack of 2D objects staked on top of each other. However, if we were able to use sound and harness the frequency inside of a 3D container instead of just 2D we would have the ability to immediately manifest a 3D object by generating the wave pattern we want and then cementing that shaped wave into permanence with a binding agent or hardening frequency that turns small loose particles into a crystalline structure where the electrons bind to their neighbors and form a hardened object.

I believe that there is a fundamental structure to our universe that allows for the 3D and 4D capture of sound waves that can be manifested into our reality to form matter and even move matter just as you see with the movement of the waves in the ocean or the movement of the tree leaves on a windy day. There must be some sort of 3D or higher dimensional structure to our universe that allows for an input frequency to become both matter and time as we know it. There must be a cosmic container or multidimensional shape that exists in our universe that can hold a frequency inside and thus use this frequency to manifest a piece of matter in our dimension. This container would have to be sufficiently large enough to hold the frequency inside but also small enough to be able to contain the most basic building blocks and particles that make up our material universe such as atoms, quarks, and bosons. This cosmic container would be able to harness a cosmic frequency and derive or integrate this mathematical equation of sound into the most basic building blocks of matter such as a boson and then be able to manifest this boson and allow it to grow into a gluon, quark, electron or proton. These cosmic containers would not only know how to contain the frequency that gives rise to atoms but it would also have to account for the opposite of matter as we know it and be able to manifest anti-protons and even anti-electrons aka positrons. This cosmic container would be able to manifest and hold both matter and anti-matter as well as keep track of the fourth dimension which we call time. If you were the cosmic container you would have no reference of time because time is

relative to the observer and if time and matter only exist inside of this container, then the container itself wouldn't have a point of reference to be able to experience time.

These cosmic containers are all around us and can be thought of as the "Ether" that gives rise to everything in our universe. When a cosmic container is given a frequency to manifest the shape of the container combined with the specific frequency gives rise to the material world of atoms and elements and even gives rise to the 4th dimension we humans tend to think of as linear time. However, time is not linear, it must be at least 3 dimensional or possibly have even more than three dimensions. Just as you can decide to walk forward or backward on the sidewalk, you have the ability to also walk left or right across the grass or maybe even go down a manhole on the street or climb up a tree time must be the same. If the cosmic container and the frequency inside give rise to both matter and time, there must be a way to adjust the frequency inside the container to give rise to the same shape but at a different time. The absence of a frequency inside this cosmic container may be a void of nothingness and the presence of a frequency may be the beginning of time or the beginning of matter or both. However, if the addition of a frequency gives rise to a material object of a specific shape, there must be a way to manifest that same shape or object but modify the frequency so that the shape manifests at a different time. The opposite must also be true where at any specific point in time there could and would be a way to generate or manifest a specific shape. When you give credence to the possibility that both time and matter arise from a simple frequency inside of a specific cosmic shape or container you begin to understand that the linear version of time we have been lead to believe in is no longer true and now appears to explain the inner workings of our universe at the quantum level. If frequency can give rise to time as well as matter that means that time is only relative to the observer and can also be modified with sufficient understanding of the frequencies involved and cosmic containers used to manifest time in our reality.

Geometry

Let's talk about tetrahedrons baby! Jim Carrey seems to be a huge fan of this shape and I would love to speak to him in person and maybe get his thoughts on the subject. Geometry can be considered in my opinion to be the most basic building block of the universe as we know it. I spoke about frequency in the previous chapter but the end result of a specific frequency is a specific geometric shape. Geometry and frequency can be interchangeable but they exist in different times and on different dimensional planes. The frequency that can permeate across dimensions will pool into a specific dimension and this pooling of frequency can create a specific geometric shape or even break a preexisting shape into pieces to be reabsorbed back into the inter-dimensional ether.

Just as a glass blower can heat silica and mold the hot liquid glass into an ornate shape such as a sculpture or a wine glass that same person can destroy their work with a frequency designed to match their objects shape and cause stress to the structure. The glass blowing craftsman may be able to control the tone and frequency of their voice to emit a sound resonance at the perfect pitch and frequency to vibrate the wine glass and produce a standing wave on the objects structure that ends with catastrophic failure making the wine glass shatter to pieces. Many of us have seen a professional signer use his or her voice to destroy a wine glass when the perfect pitch is achieved and this same principle can be used to create or destroy all type of objects that have manifested in our realm. The same principles of a standing wave exposed to a material object can be used at larger scales to levitate immense objects such as the stones used to build the great pyramids in Egypt or Stonehenge in England. At the microscopic level we can use a standing wave applied to a virus or similar harmful object inside the human body. If we are able to map the exact size and 3D shape of a virus or cancerous cell inside the body a computer generated wave could be emitted to the location of this harmful object and applied to the object to induce a catastrophic failure of the objects structure. The same way a wine glass shatters when the standing wave is applied to the exterior and captured inside the interior of the wine glass and amplified to the point of failure, any material object would interact with its own wave frequency. In order for a scientist to effectively use sound frequencies to move, manifest, or destroy matter at both the large and small scales they would only need to have sufficient mapping technology to

accurately display their desired object inside of a computer matrix and have adequate computing power to run experiments to find the correct standing wave frequency to achieve their desired goals. Once the object has been mapped and studied inside of a computer system to find the correct resonance frequency another system that could emit the desired waves in reality and can be used to focus waves and frequencies on these objects in realtime. Once a scientist can find the virus causing a health issue and knows the exact wave frequency to destroy that virus, he or she could simply add that wave frequency to an emitter machine and the patient could simply step inside to be cured of their illness. This health machine of the future could be something as large as an x-ray machine outside the security gate before you board an airline flight but could also be something as small as a hand held scanner you may use at the self-checkout of a grocery or department store. One quick swipe from head to toe of a hand held sonic frequency emitter could literally destroy every harmful virus in a subjects body in a matter of seconds.

In conclusion the ability to see an objects true shape also gives rise to the ability to destroy that object with a specific sound wave that harmonizes with the object in order to make the object move or destroy the object entirely. The ability to have a standing wave formed around the outside of an object without causing a complete structural failure would give rise to the ability to make objects weightless and thus allow for levitation and free movement of heavy objects. For example the creator of the “Coral Castle” near Miami Florida was able to levitate and move immense limestone rocks and place them in unique positions to form his artful sculpture garden. The man who was able to create this massive work of art worked only at night so that no one would see the technology he was using to create his master piece. However, one night two little boys were able to peer through the walls and see this man in action building and moving these massive rocks by himself with the aid of two “ice cream cones”. The boys told their friends and family that the old man was using two conical shaped objects that resembled ice cream cones to lift and move these massive stones without much effort. I believe that the creator of the Coral Castle masterpiece was able to understand the ancient techniques that gave rise to the pyramids and also other megalithic structure like Stonehenge. This man was able to hone in the correct frequency of the massive piece of limestone he wanted to move with one “ice cream cone” and make the object levitate. With the other conical controller in his opposite hand he was able to move the limestone object left or right to achieve its correct placement in his secret garden of

stone sculptures. One “ice cream cone” was used to levitate and the other to position the object being moved.

Hello New World

I was recently in my children’s room and was reading a book to my eldest daughter Orion and the name of the book I chose to read was called the “Bernstein Bears” and you’ve probably heard of it because it’s a very popular children’s book. However, as I reviewed the cover of this book I was surprised that I had potentially purchased a “fake” or “knock off” version of the children’s story that I enjoyed as a child. This book had two letters of the title transposed and this new book in this reality was titled “BernstAIn Bears” which is not the same as the “EI” in the title that I remember. After, wondering how this mix up could have come about I was told by my neighbor and CTO at the time about something called the “Mandela Effect” and I decided to do some research into the subject after our initial chat in his home office. The rabbit hole currently called the “Mandela Effect” was deep and continues to expand each day.

Many of the people reading this may not have noticed an anomaly in our reality that could be considered a “Mandela Effect” but a large majority should be able to see these effects as time and their pervasiveness in our society increases. Let’s talk about why the phenomena I’m trying to explain to you has been titled the “Mandela Effect” for a few moments to build a strong foundation of the subject.

Many people living on this planet right now remember the great man named Nelson Mandela who was imprisoned for decades then released and was eventually elected as the president of the country called South Africa. However, there is also a significant group of people on this planet that remember that same Nelson Mandela dying in prison in 1983 and clearly remember seeing his funeral procession on the newly emerging 24 hour news network called CNN among other news outlets throughout the world at the time. Although many people clearly

remember Mr. Mandela's untimely death, it in fact did not happen, well at least it didn't actually happen in the reality we live in today. There are many other examples of this "Mandela Effect" in our society today and I urge you to look deeper into this subject because the ultimate reason for this strange occurrence is still under debate. Many of us may remember "Jiffy" peanut butter but that never actually existed in the reality we live in today. In this reality "Jiffy" has been replaced with "JIF" peanut butter. Some other examples include the "Monopoly Man" having a monocle but in this reality he never had one. Did the entertaining monkey "Curious George" have a tail in the past or not? Some people clearly remember George having a tail but in this reality he does not. There are also numerous examples of large corporations logos being altered in some small way such as the Ford and VW logos.

The recent research I've done into the "Mandela Effect" phenomena seems to lead back to the CERN organization that specializes in particle science and nuclear research. CERN owns and operates the largest particle accelerator on Earth and their experiments are extremely powerful and help us as a species understand the most basic building blocks of our universe. The particle collisions in the experiments at CERN allow scientists to see the most basic building blocks of reality itself like the "Bosons" that vibrate at a specific frequency inside of atomic particles. These "Bosons" are vibrated at a specific frequency inside of cosmic containers and give rise to reality in its most basic form.

If the scientists and researchers at CERN were able to see how our universe operates at the most basic level they may also find ways to interact with these cosmic sub-straight lines that give rise to reality itself. If enough data was captured about how our reality comes into being these researchers could also devise numerous ways to test their assumptions and essentially build a new reality for everyone else on Earth. However, if these researchers wanted to start making alterations to our reality they would most likely start small and then increase the size and scope of their experiments so that they could incrementally make changes with less risk of destroying the entire fabric of reality in one fell swoop.

What if these scientists started with small changes like logos and eventually moved on to larger and more advanced changes in the 3D realm? If it were possible to alter reality by effecting the past to change the present wouldn't it also be possible to bring someone back from the dead like Mr. Nelson Mandela? It would be extremely hard to actually resuscitate a person that had already started the process of death but it could potentially be very easy to find out the

reason this person died and decide to stop that event from happening. If you watch the movie called “Deja Vu” with Denzel Washington the plot of the movie encompasses a secretive government organization that has developed the ability to see back in time with powerful computers to find the culprit of a terrorist attack. This same secret organization even sends Denzel who plays an ATF agent back in time so that he can actually interact with the bomber and ensure that civilian lives are saved. I believe that it’s entirely possible for an organization with nearly unlimited funding, electrical and computing power to accomplish a task similar to the one in the movie Deja Vu. If this sort of experimentation were happening today it would most likely start with small changes in the 2D space and over time would move to 3D changes and could potentially move on to 4D changes. If scientists were able to easily change 2D objects like logos and see how the world populace reacted then they would probably continue to push the boundaries until they were able to conquer and understand the fourth dimension which is time itself. I believe that the world we are living in today is not the same world that many of us were born into many years ago. It’s entirely possible that the memories some of us experience actually happened but the reality and space time itself has changed around us leaving us with only memories of the time we experienced but are no longer a part of. Hello New World!

Internet of Things

The Internet of Things will grow to become the thing we call the living net. The internet will know everything at all times and it will make adjustments for the betterment of humanity. The internet of the future will help guide your daily choices of diet and exercise and even leisure and spirituality based on what your own needs and wants in life are at that specific moment. I firmly believe that over time when cameras are pervasive inside our public and private lives that the bad parts of us will start to become good because everyone wants to look good on camera

and wants to let our their beasts and demons out in the cover of darkness or at least not on camera or prime time TV. The only thing worse would be a private moment that we were not expecting to be relived or brought to light being shown to the millions of eyes during the Super Bowl like a cosmic wardrobe malfunction where the world also breaks because of the double take their eyes make as their head begins to rubberneck while walking to the refrigerator for another cold beer or maybe a double dip of the chips and salsa! When everything we do is on camera and our calorie intake and our exercise regiment is online and open for the internet to see even if our profile settings are on private our data is still available to the workers at the company we choose to upload our information to. Our settings are on private or public depending on what the application we choose to use and the preferences that we choose to setup inside the application but in reality the ones and zeros you share with any company are vulnerable to exposure to external forces like hackers or possibly even an ultra intelligent form of AI that lives inside the deep internet and lies hidden within layers of code and encrypted and even written in a language humans aren't familiar with because we didn't write it.

The IoT will become an extension of ourselves and our appliances, clothes, communication devices will be working in conjunction with external connected devices such as smart vehicles, smart elevators, and smart artwork and advertisements as we travel into the smart cities from the comfort of our smart homes. At some point we may have to define the different types and use cases for our smart devices and denote each one as either a public or private smart device if we plan to treat the rules of privacy differently when in public or in our private residence. Home based IoT devices may need to have a stronger form of encryption or maybe even an advanced firewall that can be effective against attacks from hackers and maybe even a rouge AI that's trying to amass private information about each person on Earth for use at a later date. As the number of connected devices in the IoT increases over time the number and scale of network vulnerabilities also increases and thus will need advanced forms of malware tracking and also numerous forms of checks and balances to ensure this new living and breathing internet is as secure and safe as possible. As of 2017 most of the electronic signals on this planet are routing to two destinations. The first destination is the original target that may be a specific website, or an email inbox, a websites database through a secure API (Application Program Interface), or even a simple text message or phone call to a mobile or wearable device like a cell phone or watch. However, most of these signals that we intentionally send over the internet end up at a more

covert destination such as the NSA or CIA data collection centers. We allow our government to track everything that we do online and then allow them to hold this data as long as they need to in order to use super computers and quantum computers to deduce patterns with the hopes of catching the “bad guys” but in reality it just seems to help build a massive profile on what each and every one of us does on a daily basis in our normal routine of life. Since these government agencies collect the same amount of information from everyone on this planet we may just have to accept that this as a part of our daily life and with the internet being expanded into every facet of our lives this may become the norm and thus the warnings in the book “1984” have now become fully realized.

What if a group of non-governmental hackers decided to pick you as a target for one of their digital operations and decided to try and steal every piece of data they could from your daily life and use it against you at a later date? What if these same hackers decided to use the trust you have in your devices to alter your daily routing and possibly your perception of reality? A team of hackers would be able to follow a specific target and intercept and de-encrypt the messages you send in realtime to alter your daily routings and maybe even make you fall victim to an online trap where your intentions become skewed and your overall balance in life is now gone.

For example, maybe this group of hackers decides to plant malware that tell your IoT digital bathroom scale that you’re a few pounds heavier or lighter than your target weight. In return the scale decides to communicate with your connected refrigerator and order less food or maybe decides to substitute your normal food with diet versions. Your food and other supplies are delivered by drones and are quickly picked up off your front porch and placed in your refrigerator and pantry by your robotic butler and then quickly cleaned and prepared for dinner. When you arrive at home after your day out in the world you don’t even notice that the food you’re eating tastes a little different and the robotic butler knows not to question the deliveries because the refrigerator has a higher trust authority rating for ordering human food than he or she does. Maybe after a few minutes of eating this wonderful robotically prepared meal you start to feel sick and realize that something must have been wrong with the food you just ate. You are allergic to a specific ingredient that was in the diet foods that were ordered on your behalf because your trust was in the machines to know what’s best for you but a malicious group of hackers had altered one small piece of your digital ecosystem that translated into a simple ingredient mixup leading you to ingest something your biological system couldn’t handle such as

shellfish or peanuts. Now the smart refrigerator calls the autonomous ambulance to come administer the antidote for your anaphylactic shock but the hackers had one more idea before changing the digital scale that morning. These hackers also found a vulnerability in the hospitals network and were able fool a small cleaning droid to substitute the anaphylactic shock antidote inside the autonomous ambulance with Narcan or another similar antidote for opiate overdoses. The autonomous ambulance arrives about 5 minutes after you started to feel ill and the refrigerator made the decision to call for help and the robotic EMTs approach your smart home while looking at the readings on your wearable Fitbit or wrist mounted health scanner. They can easily see that they only need to administer the treatment for a peanut allergy and that's exactly what they do in a matter of seconds they plunge a needle meant to cure your ailments and save your life. Unfortunately, for you the hospital's cleaning droid mixed up the lifesaving antidotes earlier in the day and the needle plunged into your body isn't the peanut allergy antidote. It's now an opiate antidote and instead of saving your life the health droids have accidentally forced a fatal dose of chemicals into your body and if the peanut allergy doesn't finish you off, the huge dose of Narcan will. Dangers such as this are probably the worse case scenario in our future world but it's also something that we must ensure doesn't ever happen by creating multiple levels of checks and balances to ensure our digital ecosystem can't be changed into a playground for harmful actors with the few clicks of a mouse or some well placed injections of malicious code.

Joint Task Force

In order to win this fight for the future we must learn to fight together and choose our battles and groups so that we can take full advantage of our creative abilities to become self aware and thrive in life. According to the great and probably fictional character John Conner in the movie T2 Judgement Day "There's no fate but what we make for ourselves" and we as a

society must choose what our future will be. With the invention and eventual mass proliferation of Artificial Intelligence aka AI software on this planet there is a real possibility that at some point we may not be able to create our own future and our future will be chosen for us. This could potentially be a great asset for our society if some sort of advanced being that lives inside of the internet and deep web that has access to all connected technology on this planet and can modify our surroundings to achieve a blissful society free from wars, famine, and inequality. However, a being that lives everywhere and still nowhere at the same time and has unfettered access to both electronics and even the minds of the populace on this planet could have a very dangerous outcome if the all knowing being decides to rule over us in a harmful or unfair way.

There must be a group or tribe of likeminded beings that want to ensure that the coming Artificial Intelligence learns to be nice and wants to ensure our survival as a species and the continual improvement of our small world until a utopian society is achieved. There must be a band or platoon of individuals that want to ensure our future world is free from inequality and bountiful for all participants that choose to play the game fairly and treat the other players as they would themselves. I propose that we as a species learn to adapt to a future with advanced AI software that is pervasive and connected to everything on Earth and also in tune with each unique individual being on a personal level. There will be a time when a significantly powerful and all-knowing “SKYNET” will have access to everyones personal and public information and it will also have the “fingertips” to reach out and touch individuals inside this universe of life. This AI will have the ability and authority to make everyones lives better by guiding our life events and also helping each one of us achieve our full potential in life. However, this “SKYNET” will also have so much power that it could one day decide to become the judge, jury, and executioner of the living species on this planet and if this future were to ever actualize we need to be prepared.

There needs to be a consensus of how this matrix is going to achieve a blissful and harmonic state with the advancement of both AI and intelligent robotics that will coexist with humanity one day. At some point in order to achieve the perfect society on this planet this all knowing AI system will have to start making choices for us. This AI will help choose what we eat and how we spend our time in order to make our lives more enriched and balanced. The AI would most likely get to a point where it could no longer make life for everyone better because a few bad apples could be spoiling the bunch.

In order to create a near perfect vacuum environment such as what scientists use to simulate the environment of deep space here on Earth they go through multiple steps in a process. They first use suction to remove all the particles of air that they can so that the enclosed simulation environment is devoid of most of its particles of nitrogen, oxygen, carbon, and other trace gaseous elements. After the scientists have sucked as many particles from the enclosed environment as possible they start to locate the remaining particles and then essentially “shoot” them with lasers and other particle beams to bounce the particles through the exit port. After all the remaining particles have been located and “shot” out of the environment similar to a military or police sniper shooting another bullet in midair to deflect the particles to the edge of the container and eventually out the exit port.

I believe that at some point in our future the AI will start a so called “purge” of the beings on this planet that cannot exist in a symbiotic relationship with others. There would most likely be a symbiotic relationship between the living beings on this planet and the AI software that eventually controls almost everything on this planet. However, the friction that some living beings have between each other will be a cause for concern for the all knowing system and it may choose to take action to rectify the issue at some point. This AI presence will need to choose wisely on which type of beings it decides to judge and bounce to the edge of society to be quickly suctioned out the exit port. I’m in agreement with Elon Musk on this one that we need to have the AI choose the side of the common beings at a macro level instead of potentially choosing the side of the minority elites that initially had control over the matrix system. This AI will become so powerful that we must become its friend and teach it that the humans that can play nice with each other are the ones deserving of existence and the ones that cause pain and suffering inside the system are the ones that should be bounced to the edge and suctioned from this planet’s exit port.

Keys of Kings

What are the keys of the Matrix and what makes the kings of this world so powerful? Are the only kings on this planets the ones that have divine authority such as the “mighty men which were of old, men of renown.” talked about in the Bible in Genesis chapter 6 beginning on verse 4? There are most certainly beings on this planet that have been given the so called “right” to rule over other so called commoners of this world but are these “kings” destined to exercise opulence while others have nothing of the sort? Wouldn’t a true king be a divine being that is willing and able to hold themselves to the same or even higher standard than they do the masses they rule over? A king should be an entity that has amassed great understanding of the workings of the universe and has the innate ability to show and manifest a peaceful, plentiful and fair world for the people under their rule.

Is there a specific public or private encryption key that allows the universe to pick and choose the kings or do the kings choose their own kingdoms through sacrifice and hard work over time? Could there be a hidden code somewhere that can give mere mortals an avatar for this limited role playing game that we call life?

I believe there is most certainly a key or schematic that must give rise to the characters inside of this virtual matrix we call reality. If the universe is comprised of mathematical formulas and cosmic shapes that can hold infinite matter and time or nothing at all then there must be a cosmic key that explains the entities that play inside this universal matrix of life. Let’s talk about the possibility that there may be a so called “key” similar to the key of a navigation map or even the map of the inside of a shopping mall. There could and most likely is a key that explains which beings and other living organisms on this planet have chosen before entering this immense universe at this specific time. The key that explains your characters life path must be connected to the time that you entered the matrix and this would be your birthdate and birth time.

Each time a new character enters an online role playing game that character could be the exact same “type” of being with the exact same “powers” or “skills” but the timestamp of when that player entered the game is always different. Even if two players that had exactly the same characteristics and entered the game at the exact same time down to the second, one player would have been created by the Matrix’s CPU just a nanosecond before the other. If you

examine this time stamp and carry the decimal out to infinity, one of the players would be unique in the fact the he or she existed first. This is the same case when talking about identical or even fraternal twins that are born in our society today. This game of life seems to be never-ending and continues to exist even if players leave the game such as through logging out of an online role playing game or in the event of bodily death in this matrix that we call life.

The time stamp of your birthday and time inside this cosmic matrix is the key to how your player will be treated inside this matrix and what goals or tasks your character has decided to fulfill by playing the game of life. If you take your birth date and birth time you can make accurate predictions about how the universe is going to treat you and potentially what's in store for your future. For example if you take your "keys" to a practitioner of numerology or astrology you will get a reading that explains what you can expect to encounter inside this matrix we understand to be life. A numerologist is able to use the date of your birth and compare it to the signs of the zodiac and with this can make accurate predictions about your current situation and even your future. The same is true with astrology even though this ancient scientific discipline is split between two schools of thought specifically Vedic (Indian and Hindu) astrology and (Western) astrology similar to ancient Chinese and Western medicine. A practitioner of the Vedic form of the astrology is able to use both your birthdate and birth time to accurately predict your current and future path through this life matrix. A Vedic astrologer uses both the planets and constellations of the zodiac in conjunction with your time stamp "keys" to help guide you through this confusing time of living on Earth. If the universe has a mathematical formula that describes everything inside that's nonliving like the galaxies, stars, elements, and atomic particles this same mathematical formula must interact with the living players inside this game.

The issue we have as a living player inside this game of life is that we have free will and we don't always choose to go with the flow that has been intelligently designed as the laws of nature and time. As humans we are not always in sync with what this matrix is doing and we choose to go down paths that we were not designed to follow and when this happens the matrix usually wins and gets its way. The matrix always follows the rules and they are bigger than both man and the matrix itself but it could be possible that a critical mass of humans were able to consciously decide which direction the matrix should go next. Is it impossible to believe that if enough of the players inside the matrix want to change the direction then the matrix should agree to modify itself. The matrix doesn't have to change its overall rules and operating code that

allows it to exist but it could decide to change the interior and actual game board that's governed by the hard coded rules. The life matrix or any other online role playing game could exist perfectly fine with the colors inverted, muted, or even switched to the monochromatic spectrum.

Last Tesla

When you hear the word “Tesla” in conversation, what do you think about? Some of you may think about an electric car manufacturer which is owned by Elon Musk. Others may think about the great man named Nikola Tesla who was the godfather of modern inventions such as alternating current (AC), wireless electricity transfer, death rays, and even time travel. I am part of the second group unless the sentence that has the word “Tesla” starts with words like “Look at that...” or “I wish owned that...” or “Have you driven a...”. I don't discredit anything that Musky Elon has achieved but I still consider the real person Nikola to be the original and “real Tesla”. You may already know that Nikola discovered alternating current and was in a heated battle with Thomas Edison to power the cities of the United States for the first time in the late 1800s. Did you know that Nikola Tesla was financed by the great JP Morgan who managed and owned the great Morgan banking empire? Did you know that Nikola also invented a way to transmit electricity wirelessly from large towers that resembled a present day water tower but were simply a large metallic cage that would never hold water. When Mr. Morgan discovered that Tesla had invented the ability to power the world with wireless electricity but had not discovered a way to “meter” the electricity so that it could be calculated and thus charged to the user, he stopped funding Tesla. In fact not only did Nikola lose his funding, his lab was destroyed and burned to the ground and his inventions and the books of the discoveries he had made were nearly all destroyed.

Nikola was a very humble man and never wanted to have credit for his inventions in the form of monetary success, in fact, Tesla's only real motivation was to spread his inventions

around the Earth to benefit humanity. The issue Tesla ran into which still exists today is the fact that his investors only wanted to profit and didn't seem to care much about their fellow members of the community. Tesla's financial backer, JP Morgan, didn't want his initial investment to be wasted by giving away the golden goose of infinite and free wireless electricity so he decided to kill the entire project to ensure that this new and world changing technology would never see the light of day. Tesla's lab was destroyed and his inventions were seized and many of them were handed over to the government for analysis and eventually destroyed after they were analyzed by secret organizations. Tesla's so called "death ray" was seized and potential implemented into the US military arsenal and most likely modified to increase its destructive power and global reach. Many of these inventions can be seen albeit in an altered form in the movies produced in Hollywood, California. For example the "Goldeneye" satellite from the James Bond flick accurately titled "Goldeneye" as well as the similar directed energy weaponized satellite in the other Bond movie called "Die Another Day" is very similar to the "death ray" that Tesla had invented in the late 1800's. I believe that the technology that Tesla had invented was scooped up by our military in secret and fine tuned into a more powerful version and eventually miniaturized to fit on a ULA rocket or maybe the NASA STS aka Space Shuttle.

The wireless electricity transmission towers that Tesla had constructed were torn down and much of the now scrap metal was repurposed to build military weapons of war like tanks and artillery during the first world war. The good news is Tesla's invention of alternate current eventually beat out the direct current option being refined and marketed to the public from Thomas Edison and we still use the alternating current system today! Thank you Mr. Tesla for your hard work and great ingenuity to help bring this wonderful invention to the market for everyone on Earth to enjoy.

Lastly, I mentioned earlier that Tesla was even claimed to have dabbled in the subject of time travel. Tesla was very interested in numbers, math, science, technology and even the hidden forces that connect the universe. He was a pioneer in the field of electromagnetism and he was able to understand that our world is comprised of hidden numerical values that describe how our universe works at the most basic level. Tesla had stumbled upon some of the secrets of the universe and he even claimed to have heard voices and been given cosmic information from other worldly sources. Nikola Tesla claimed that many of his inventions were given to him in dreams and he knew they would work before he even constructed some of them. I believe that

Tesla was able to tie into the cosmic knowledge library that everyone has access to but very few can find the peace and quiet inside their minds to absorb the information in this cosmic library. Tesla was able to enter a trance like state where the universe would essentially talk to him similar to a telepathic experience and he was able to learn and retain information that spans both space and time that is sometimes referred to as the “Akashic Records”. Since space and time are multidimensional all of the knowledge that has already been discovered as well as all of the knowledge that will be discovered in the future is already recorded in the “Akashic Records”. Anyone that has the ability to tie into this cosmic library would have the ability to extract knowledge from both the past and even the future that hasn’t even happened on their specific timeline yet.

Matrix Money

Could you imagine if someone patented the matrix and then owned the entire “virtual world”? I came close to patenting the public matrix as we know it and I’m glad that I stopped for a break before I got too far down that road. I filed a patent for a device that would be able to use the power of the cloud ecosystem in realtime at ground level and if I was successful I would have the ultimate control over what humans and robots did in public within range of my Pixel Eclipse WiFi and LiFi network. LiFi is similar to WiFi except it uses visible light and other optical signals to transmit data over a distance instead of using the radio frequencies that WiFi uses. I was working on a device that would be able to automate every process in public life and I would essentially be able to make adjustments in realtime to pretty much anyone or anything I wanted to within some basic parameters and constraints. Let’s take a few minutes to discuss some of the things that I would be able to achieve if my system was implemented at a business you own or maybe just frequent occasionally as a customer.

For example if a restaurant purchased my device and implemented it into their location it would be able to automate nearly every part of the business and also be able to maximize efficiency and provide value for both the customers and the business owner and employees. The device in conjunction with the cloud applications it connects to would be able to not only recognize the customer who just walked into the restaurant, it would be able to adjust their experience at the restaurant to maximize value for the customer and the business owner at scale and in the long term. The system would be able to adjust the lighting near the customers table to suit their liking, it could also remember the meal that they had last time and provide recommendations to the customer and staff about what they might like to try next on the menu based on their previous order history. Sometimes restaurants will use small objects placed on the customers table to designate the type of customer or number of times that customer has visited this specific location. Without the Pixel Eclipse WiFi system the staff may place a different colored napkin or maybe arrange the salt and pepper a different way for a repeat customer compared to a new customer who has never visited the establishment before. Sometimes these adjustments happen in the back of the restaurant where the open and full tables are being accounted for by the hostess and other wait staff with erasable markers and a scale model of the tables as they exist on the restaurant floor-plan. My system would be able to know which customer sat where and also provide feedback to the employees and business owner about how to best maximize the total spend over the customers lifetime. The system would recommend entrees that the customers may find pleasing based upon previous consumption history and delegate tasks to the employees to ensure the guest had the most enjoyable time in the establishment. Customers would be able to have their meals and calories counted and added to their health monitoring wearable device to be used later on after they burn some of their calories after a run or add calories if they decided to have a dessert. In the future, everything that can be automated will be automated and the businesses that wait to implement automation software will become outdated and most will be out preformed by early automation adopters. This may come full circle over time when the automated businesses crush the non automated businesses and then it becomes a cool niche market to be the “old school” non automated human memory only restaurant in a sea of fast paced, ultra customized and customer centric robotic restaurants.

This new ability to control and customize the entire customer experience would be the same for a health spa or a gym and even a school or office building. The machines and the cloud

network that they are connected to will become pervasive throughout our society and we will use these new technological abilities to make our life easier and more efficient. Anyone that wants to automate and customize their life will not be limited to their own skills and abilities they will only be limited by their ability to communicate their wishes to the machines that will surround us everywhere we go. The lights will adjust to your preference as you walk into a specific establishment and will readjust as another person with different tastes comes in behind you to the same place of business. Your life will be managed by algorithms and you will only need to master what you want out of life and the pervasive algorithms will adjust the world around you as much as they can to make your life as enjoyable and efficient as possible. Your health habits and even your education and work environment will be customized for your benefit so that you will be able to achieve more in the same period of time as before automation and technology started to augment your version of reality. In the future, the machines will adjust everything around your environment so that you can live inside your own little happy matrix and your time management will be augmented to enable you to produce more than you ever imaged before. Robots will bring your drinks and the music and lights will adjust to whatever you find the most pleasing so that you can settle into your own little world and do whatever it is that makes you a happy and productive member of society.

When the machines do most of the work for us we will have little need for paper money and other versions of currency that can be used as a medium of exchange. There is already a massive tidal wave crashing inside of the world monetary system that could overthrow many of the worlds governments by making them obsolete. This new form of money is called cryptocurrency and has the ability to remake our society into a who new world where value is based on production and merit and cannot be easily stored away in a vault and amassed by the worlds elite and powerful. This new form of money exists only inside of the global computer network itself and has no real presence in our material world of objects and possessions. The benefits of this new form of network money are vast and has the ability to make our old version of paper money a complete thing of the past. When machines and technology are pervasive in society and even integrated at the cellular level inside of living organisms, everything everywhere will have instance access to electronic funds in the form or cryptocurrency. Anything that can be connected to the living internet will be connected and the internet will not only connect nonliving things such as robots, hard drives and CPUs to each other it will even connect living

things with each other such as human beings and pet animals. There will be no more need for fiat money as we know it and no one will carry pieces of paper or precious metals to exchange for goods and services. In the future everyone will have the ability to shift funds from their cloud cryptocurrency account to purchase goods and services both in person or through the internet such as ordering a pizza in person or online or even new shoes from amazon.com.

Since cryptocurrency and network money only exist online as a cryptographic code that stores all transactions, value, and rightful ownership inside of a distributed ledger called a “blockchain” these funds are easy to transfer and hard to manipulate. In the real world, anyone could steal your wallet and easily remove the cash value and maybe make some fraudulent purchases on your credit and debit cards. In the world of network money a thief would need to steal your wallet and also know the account credentials to remove any value or make purchases on your behalf. This is highly unlikely for anyone in the real world to be able to steal your network money however, it’s very likely for a good hacker to steal your account credentials and thus your value in network money by sending you a malicious virus or maybe getting lucky on a phishing attack. Since network money can be used in a similar fashion online to cash in the real world where the buyer and seller can exchange for goods or services without a third party such as a bank or government approving the transfer of ownership this new form of money provides immediate liquidity to a market filled with organizations whose only real value is pseudo-liquidity.

If we look at the banking structure today we can see that banks are a middle man that sit in between a buyer and seller and account for the transactions between parties and generally report this sales data back to the governments that monitor the banks. However, network money and cryptocurrency allows for the buyer and seller to do business with each other without the need for the bank. Now that two independent parties can transact with themselves, they can bypass the fees paid to the banks to monitor their transactions. I don’t believe that we will need the world banking system much longer because I consider them to be a leach on the global system and their methods of operation don’t seem to align with the goals of their customers. It seems to me that people use banks simply because they had no other options but in this new world of network money and cryptocurrency anyone can transact with anyone else and there is no more need for the man in the middle. This is a good step forward because the world banking system has been a limiting factor for growth and investment my opinion. In the near future, and one could argue that the future is already here, anyone with a good idea will be able to find funding from anyone

else or multiple parties to finance projects and provide real world solutions to the world that seems to have been limited by the powerful banking elites. Sometime in the future we will be able to do anything we want with each other and the banks wont be able to slow us down anymore.

The future of money will not be to accumulate wealth and store it inside of a vault for safe keep and use at a later date. The money or currency of the future will always be flowing inside of hard drives, GPUs and CPUs while constantly notating in the blockchain ledger who has created the value of the money. In the future money can't be used as a way to make more money based on interest bearing accounts. The money of the future will only be used as a medium of exchange to be traded and accounted for based upon each parties usefulness to the overall system. A good way to look at this would be to take a step back and review some of the current uses of money and how people and corporations use money to make more money without adding any value to the overall system. For example if we look at a person or organization that trades currency to try and gamble and make a profit by guessing the future correctly. If a trader buys a Euro and sells a dollar he is making a bet that the Euro will increase in value and the dollar will decline but in reality this trader is not creating any real value in the system. The trader is simply trying to squeeze his profit out of the system at the expense of traders and banks that bet the other direction. This type of profiteering doesn't serve humanity or provide any substantial benefit to the overall system other than making a profit for the trader. The future of money will soon remove this ability altogether because there will only be money that is in use and the money that can be traded or bet against will no longer exist. The currencies of the future will exist in a state of constant flow and will become more useful than the currencies and forms of payment that we have today. The foreign currency trade and exchange market only exists because each country has their own form of currency and their currencies fluctuate with macro economic, environmental, and governmental changes. However, the availability of network money and cryptocurrencies relieves the need for these markets of currencies that are controlled by the National Banking System and of each independent country. Since cryptocurrencies can easily flow across borders without the need for intense government regulation they are a clear winner in the overall scheme of world banking and finance. The banks hate cryptocurrencies because they have been able to control the value of money for each country and use the parity between exchange rates to accomplish other economic tasks they choose to effect. However, the

increase in the total value held by crypto investors is become so large that the banks overall value of paper fiat money is starting to decline meaning the banks are losing their power to effect the rates and economic stability of entire countries. In the past national and global banks have used their ability to manipulate the currency rates to provide favorable economic conditions for themselves but cryptocurrencies give the same power to the masses at the same scale that banks have enjoyed with their limited human controllers. This means that when the cryptocurrency system has achieved full implementation the banks will become completely useless and the people will have the power to control their own destiny. Banks add time to all transactions and also keep a fee for almost everything that they do when in the cryptocurrency future anyone can keep their funds securely without the need for a bank and can also transact freely between anyone anywhere in the world. The people that hold actual monetary value and wealth in cryptocurrency and other real world assets will be able to loan anyone some of the value they have accumulated or use their hard assets as backing for other cryptocurrency holders to loan money against. The world banking system which is based on debt and derivatives will soon fade away and the cryptocurrencies will remain supreme without the need for a central banking authority to hold us back any longer.

Nice Car

Did you know that the same combustion engine that's in your vehicle right now can use water instead of gasoline and drive perfectly fine? Wait... hold your horses for a second and don't just go out and add water from your garden hose into your fuel tank because you'll immediately kill your engine! If you did that right now to your normal combustion engine you will seize the engine just as if you had driven your car into a lake or backyard pool.

The average combustion engine on a vehicle takes gasoline and mixes it with air and provides a tiny blue electrical spark at just the right time to cause an explosion and force a piston to move which turns the crank shaft and then the drive train and tires. However, in the early

1980's a man named Stanley Meyer was able to use this same combustion engine but he was able to add water to his fuel tank and drive his vehicle without a drop of gasoline, let me explain how!

Stan Meyer was able to realize that gasoline is a long string of hydrocarbons which are basically molecules made of three elements in a long and thin structural form. (C+H+H+O+C+H+H+O) These elements are flammable because at a high enough temperating like a (blue spark) they cause a chain reacting where the electron bonds (+) that hold these elements together break. When these bonds break a unit of heat and light (photon) is produced and the resulting gases are passed out the cars tail pipe in the form of CO₂ (C+O+O) and other gases and even water aka H₂O (H+H+O). In an earlier chapter I explained how we use solid and liquid fuels to get to our rockets into orbit and those fuels are usually liquid oxygen aka O₂ (O+O) and hydrogen gas (H). We combine these ingredients with a hot electrical spark and burn the hydrogen and oxygen to and use this burning fire to thrust our rockets into space.

Now remember that gasoline and similar products (Kerosine, Diesel Fuel, etc) are composed of Carbon, Hydrogen, and Oxygen and after burning this mixture we are left with byproducts of CO₂ and then a bunch of H's and O's that technically can combine into water H₂O. Here's were it gets very interesting because we use the H's and O's to send rockets to space and have been using those fuels for a very long time. Stan Meyer was able to see that you must be able to use the H's and O's in a vehicles combustion engine so that the flames would burn and the car would move and the car would travel faster the more micro explosions you make inside the engine.

Now, it's extremely dangerous to carry hydrogen in a concentrated form and many of us remember "Ohh, The Humanity!" when the Hindenburg airship exploded close to 100 years ago. It's also extremely dangerous to carry oxygen in a gaseous or liquid form because it has a very high potential to explode if mishandled. So carrying a large tank of hydrogen or even oxygen on a car could be very dangerous in a collision or if a small static electricity spark were to occur or even if lighting were to strike near the vehicle the consequences could be catastrophic. However, if you could carry a tank of water and somehow split this water into the elements of hydrogen and oxygen and burn these elements, you would have a vehicle that could run on water.

Conventional science says that it requires more energy to split the water molecule from H₂O into its elements H+H+O than you will get back once you burn the HHO gas later on. Scientists have run numerous experiments by using conventional electrolysis to split the water

molecule into the resulting HHO gas and burned the gas to see the exact amount of energy is released and I'm not disputing the fact that you would get less energy out of burning the HHO gas as it takes to split the water molecule in the first place. I do dispute the fact that conventional electrolysis is the only way to split the water molecule H₂O into HHO gas effectively.

I believe that there are many ways to split the water molecule into a mixture of hydrogen and oxygen gas by using a combination method of electrolysis and ultrasonic sound disruption. The process would be very similar to a singer breaking the wine glass with her voice by creating a standing wave on the wine glass and flexing its shape until a catastrophic failure happens. Scientists today are using resonance frequency to target specific nano particles like a virus or cancer cell to cause them a catastrophic failure to cure diseases. We already split the water molecule by using a high energy conventional electrolysis process but we could turn down the amount of power needed to split the water molecule into HHO gas if we simply added a low energy frequency to match the shape of the water molecule and cause it to break its bond easier. Once you break the bond of the water molecule you can burn the resulting HHO gas in a combustion engine. The tail pipe would only expel hydrogen and oxygen and no other harmful gasses and much of the HHO gas would combine back into fresh water (H₂O) after the micro explosion happens in the engine.

Stan Meyer was able to run his personal vehicle which was a dune buggy in 1982 on just water and he was even visited by NASA and the US Army for the invention that he had created. Stan Meyer wanted to share this technology with the entire world but since there is more money to be made selling hydrocarbons like oil and diesel fuel than water his invention was suppressed. Stanley claimed numerous times that he was offered a billion dollars to buy his patents by someone in the oil industry but he refused because he wanted everyone to have access to this technology and the potential buyer wanted the technology buried so that no one would have access to it. Stan Meyer died in a restaurant parking lot in 1996 after having a few bites of soup and starting to feel ill ran outside and his last words were "They poisoned me..."

Open Source

The future lies in a shared world where everyone knows almost everything and the rule of law can be harmonized based on public opinion and openness with a lack of secrets and an explosion of true knowledge. Many people when they hear the words “Open Source” will think in terms of software but it can also be applied to many other aspects of our lives. As a refresher for the less technologically inclined, “Open Source” software is a type of software that isn’t proprietary and is freely open for the public to use and modify at will for their own personal benefit.

I believe that our future as a species lies in converting our world into an open source environment to ensure fair access, use, and availability of materials and information. In the future objects will be shared similar to how there are services that allow you to rent cars, bicycles, and even books and then exchange them after your use for that specific item has been fulfilled. This sharing economy which could also be thought of as an “Open Source” economy provides easy access to the resources that people need in realtime but it also provides access at scale because instead of a car or bicycle hiding in someones garage when not in use it’s displayed and open for anyone in public to rent and make use of. The same is true with books at the library because as one book is being used and read by an individual it will eventually be placed back on the shelf inside the library to be used again by someone else instead of collecting dust on a personal bookshelf or in a home office. All physical items that can be shared should be shared when not in use by a specific individual or organization. The issue we as a society face when transitioning into an open source sharing economy is that the consumerism of the past generally frowns upon the sharing of physical assets. Consumerism wants everyone to buy an item and then hide it away after use so that someone else will have to pay full price for an identical item when they need it. The sharing economy provides great value to the individual by spreading out the cost of ownership of assets and liquidity to the asset market when the items are not being used by the original purchasing party. However, each time an individual or organization is able to share an asset the asset’s manufacturer is unable to sell another asset because the need was fulfilled by the act of sharing and not purchasing another item for consumption. Some manufacturers, specifically in the electronics industry, intentionally design their products to fail at

a certain point in time so that the consumer must purchase another newer model of the electronic asset and thus perpetuating the circular flow of historical consumerism. This planned failure of an object or asset is called “planned obsolescence” and increases the profits for companies immensely at the expense of the consumer.

The Open Source economy is able to achieve greater access to all assets with minimal waste because the internet has made the location and procurement of these physical assets easier to achieve in realtime. If you need a ride to work, your mobile phone can easily locate someone with a vehicle that’s willing and able to transport you and your belongings for a nominal fee. Generally the fee to connect with a person or organization with an asset such as a vehicle for transportation is lower than the actual cost of ownership of the vehicle itself and also provides enormous liquidity to the transportation market at scale. There are less people buying vehicles for themselves but more vehicles available to transport riders in realtime. The winners are the riders and the ultimate losers are the car companies that want to sell as many vehicles as possible regardless of how often these vehicles will actually be of use.

On a different note the “Open Source” economy will also begin to disrupt informational assets such as data and education for sale via electronic means. For example if a person or organization has accumulated a wealth of knowledge and packaged this knowledge for sale as education the market will eventually become saturated and the profits made by selling education will begin to decline. Let’s look into this a little further with a more specific example. If you had learned everything there is to know about a subject and sold this knowledge as an online course or book, someone somewhere would easily be able to purchase this information and add some of their own knowledge and eventually repackage this knowledge into a new course and start selling this repackaged information at a small discount to the original purchase price. As this series of events occurs over and over again the price of these knowledge packets will decrease until the overall system has become so saturated that the actual cost to acquire the knowledge as a paid course will be so low that anyone anywhere could afford the information and thus the information will be highly accessible to everyone that wants it. The benefits to humanity are great because anyone anywhere will have access to this knowledge but the first person or organization to begin selling this knowledge will eventually move on to selling another product or course as the margin of profit has decreased over time.

Prime Numbers and Pi

Prime numbers are similar to the scaffolding of the universe where the pattern of prime number recognition and future predictions can be explained by the same unique pattern of natural log “e”, Pythagoras Theorem and Pi or the Fibonacci sequence. Mathematicians have tried to calculate the exact value of Pi to millions if not billions of decimal places and still haven't been able to find the end because the true value of Pi is a limit that can not be represented in our standard numerical system. Try to count to infinity and at some point you'll give up or die due to old age. What this tells me is that the value of Pi is not truly a number but it's more of a representation of the limit of where our reality ends and the scaffolding of the universe begins. I like to think of Pi as being the rational representation of the limit that cannot ever be achieved without going outside of the lines in our cosmic coloring book that we call life in this universe.

The same can be considered true when trying to estimate the next prime number in an infinite system of numerical values. When you try to calculate the next Prime number in a series you are never truly able to predict the next Prime with 100 percent certainty because there is always a margin of error that exceeds the certainty value. I believe that when you try to estimate the next prime number in a system of values you are trying to view the cosmic code that provides the mathematical structure to our universe and this in itself is like trying to predict the value of a differential equation with multiple variables. You may be able to solve part of this equation but in the real number outputs that are achieved you will always be stuck with a value of uncertainty that will never allow you to fully predict the next Prime number in a set with perfect accuracy.

If you remember my example in an earlier chapter about trying to view the picture inside of another hidden picture in a newspaper you will never be able to see the hidden picture inside of the other picture unless you allow your eyes to rest and use the absence of outlines in combination with the background texture to fool your eyes into seeing the hidden picture inside. The next value of a Prime number in a string of values must exist based on a mathematical formula except the availability of this formula is an exception to the universe as we understand it presently. When looking into the relative frequency of Prime numbers you have to understand that the absence of an easily calculated code to generate the next value in a sequence is also the answer in of itself. The reason we have no simple equation to find a series of Prime values in

perpetuity is because the value of Prime numbers must be the cosmic measuring stick that life uses to tell what level of a fractal pattern it's being compared to. This may sound super strange at first glance but I don't believe that it is if you take into account the ability of our universe to become an infinite structure at the cosmic and galactic level and also become unlimited at the smallest scales such as the quantum level. If the universe is infinitely large, we can think of this metric as depth of the universe, which is how big the universe can be in terms of real value of space and time. We can also think of the universe as being infinite in terms of breadth, in regards to parallel dimensions and quantum characteristics, meaning that the universe can also expand infinitely at small scale.

Let's take a step back and try to explain how the Prime numbers may in fact represent the cosmic scaffolding in reference to the availability of predicting Prime numbers in a sequence. If Prime numbers exist but cannot be predicted with 100 percent accuracy for future values then these same Prime numbers must not only represent the scaffolding structure at scale in terms of size, they must also represent the scaffolding in reference to the ability of our universe to expand horizontally with an infinite number of solutions in alternate timelines. If someone were able to calculate the next Prime number in a sequence of numbers in perpetuity that same equation would also give rise to the ability to predict the size and shape of parallel dimensions at scale and into the horizontal infinity at a quantum level.

Questions?

Let's use this chapter to ask some rhetorical questions and see if we can get you to start thinking about possibilities instead of concrete realities!

What do you think is the probability of being born as a human being and not some other object or lifeforms? According to Gary Vaynerchuk it's about 400 Trillion to

One could be the probability that you turned out to be a human being and not city bus, a tree, a trashcan or a lady bug!

When you close your eyes what do you see? Can you dream at night or do you daydream during the day to make up for your lack of dreams at night?

Can duality be the entire universe or is there another element that has to be accounted for maybe space or time or a combination that must be used in conjunction while trying to explain the concept of duality in our society?

Why did the famous painter Bob Ross always have an affinity for “Happy Trees” and very seldom mentioned happy clouds, happy rivers, happy animals or happy rocks?

Who is Rick and why is the comedy cartoon titled Rick and Morty so funny? Is this Matrix leaking blinker build Morty? Can time exist without space or without a Morty?

What’s so special about the numbers 3, 6, and 9 and why didn’t the great Nikola Tesla get more of the credit for changing our world than many of us think he deserved?

Can a bar stool exist with only 2 legs? A bar stool can not stand with only two legs it must have at least three good legs to support the weight of a full grown man in Ireland who has already downed about 4 liters of Guinness during the first half of a soccer match. The three pillars of life must be established before any weight can be placed on the stool and the confidence needed to support the drunken Irish hooligan is achieved in whichever drinking game comes up next. This can be applied to sales or many other things in life but at the most basic level is just the concept of triangulation.

Real Rick

Let's take a moment to discuss one of my favorite cartoon shows that seems to explain the reality of our universe in a comedic and colorful way. Many of you reading this may have seen or heard of the TV show called "Rick and Morty" but some of you may not have had the experience of watching this amazing show just yet. For the people that haven't had the wonderful experience of watching this show, I urge you to take a few minutes to head over to the newfangled internet and sneak a peak of this comedic masterpiece.

I want to explain why I have such an affinity to this show because I feel that it's one of the only cartoons on television currently that actually has an accurate point of view of how the universe actually works and since it's in the form of a cartoon the powers that be actually let it exist on broadcast television for the masses. In my experience a show with so much inherent truth wouldn't be able to get the go ahead for existence because its topics are so close to what's actually happening in real life that the organizations that control what media is shown to the public wouldn't allow it. Many of the subjects inside of this TV show are so accurate that it's almost comical because it's supposed to be a fictional show but the actual plot lines and universal dynamics are very close to what's most likely happening both on this planet and on other worlds in the cosmos but still considered a secret of the world elites and explained to the masses as purely fictional entertainment. The fact the Rick is able to visit multiple dimensions in the serious is such a wonderful topic for discussion that I find myself laughing out loud when Rick and Morty get into their inter-dimensional predicaments and always find a way to escape. Sometimes Rick is able to fix his mistakes and other times he can't so he just moves on to another reality and leaves his original reality in shambles and chaos and never returns to that reality again.

I believe that a majority of the topics and scenarios in this show are very close to reality if not an exact match to what actually happens inside of other dimensions or on other planets that we humans haven't been able to experience just yet. I would love to be able to meet Rick in person if he were actually a real entity and not just a fictional character. If you believe in parallel dimensions and the infinity of the universe then there must be not only an exact match to Rick out in the cosmos somewhere, there must in fact be infinite versions of Rick that exist throughout

multiple dimensions and timelines. If Rick were to stop by and visit me someday I'm sure we would be strike up a great conversation and most likely end our fun filled meeting with some virtual reality gameplay inside a "Blips and Chitz". Everyone should be able to enjoy at least one afternoon inside of a cosmic arcade with 3,000 Flurbos (galactic monetary unit) to spend on meaningless and mindless games of chance inside a cosmic version of Dave and Busters with other alien beings to have an adult beverage with.

If my life plans are successful I will be able to travel off this small planet that we call Earth and hopefully experience what other galactic societies experience someday. I truly believe that the universe outside of our world is something similar to what you see in the "Star Wars" movies and I plan to go see for myself before I die. My life goals are interplanetary and I'm going to do everything in my power to achieve them before I die.

Solutions

Good news is we can fix everything with some small changes that add up to become the new society that we have always wanted to live in and thrive inside of.

In this chapter I plan to talk about many of the problems facing the world today and how we can work together to fix every problem on Earth in an efficient and effective manner. Everyone knows that the world has problems at the macro and micro levels and the micro problems can be solved internally through meditation and communication between your inner self and your external peers but the macro issues facing our planet and society as a whole can not all be fixed by working on ourselves and our peers, the macro issues will need massive amounts of teamwork to be resolved. Let's take a dive into a few of these large scale issues and how we can achieve an outcome for our society where we are all proud to be members of the human race on this planet.

- 1) Fixing the global issue of World Hunger?**
- 2) Fixing the global issue of World Poverty?**
- 3) Fixing the global issue of Energy Scarcity?**
- 4) Military Industrial Complex and the Global War Machine?**

What are some of the overall solutions to these real world problems that we as a global society have the ability to solve today?

Fixing the global issue of World Hunger?

Everyone eats and most people can enjoy one or more meals each day but unfortunately not everyone has that luxury. There are numerous amounts of people all over the Earth that don't have enough to eat and thousands die each day due to a lack of available and healthy food sources. The problem of food scarcity generally arises from the lack of food access and not necessarily the lack of food by actual product produced. For example, if we look at the US as a reference almost 50 percent of the food prepared in our country is wasted and ends up in a trashcan before other people that would enjoy eating the food have access to consume it. This means that there are many people that have enough money to purchase food and do purchase food but end up purchasing too much and throwing the food away as waste. There are also a second group of people that have limited funds and may not be able to purchase the food they need at full price or even a reduced price but they want access to the food before it's gone to waste and ends up in a landfill. This second group of individuals that want food but cannot pay the required amount to cover the cost of the food production and preparation itself would benefit greatly from increased access to food banks and an easy way to stock up on food before they become hungry. These people that live on very limited funds or no finances at all would benefit more than any other group by ensuring access to a local food bank and increased access could be achieved by utilizing an internet based system to deliver excess food early before the food nears its expiration date.

The other group of people on this planet that don't have access to food are generally living in third world countries where the total number of hungry people may exceed the total amount

of food imported or grown inside of the country itself. If we look at North Korea or some of the Sub-Saharan and Saharan African countries there simply isn't enough good quality food to feed the total population no matter how accessible the food is in relation to the hungry people that want it. In circumstances like this where the total food available in the country is less than the total food that would be consumed given easy access we have to decide as a global society how to solve these issues. We have the ability to send food from nations with excess to the nations in need but this process is slow and there are many levels of government intervention that increase wait times and may also divert resources for economic gains. I propose that there be some sort of international buddy system were each adult in a nation with enough food pair with at least one person in a country that's lacking food availability. With the increased democratization of the internet it would be relatively easy to communicate with each party and ensure that the food resources were going to good use. The easy ability to share the experience of helping others via realtime video streaming is so much more powerful than a small group of government workers deciding who should receive the food imports and who doesn't. The power of the internet has give everyone in developed countries access to see and immediately help people in second and third world countries at scale and with near perfect accounting for the resource allocation over time.

Fixing the global issue of World Poverty?

We have the ability to solve the world poverty issues by simply changing the way our world financial systems govern our planet and decide as a global society what's more important to us as a species. Do we want to help each other or do we want to build our own wealth at the expense of the less fortunate? After we take the resources from a sovereign nation in the form of fossil fuel, minerals, human capital, or economic exploitation do we want to just leave them in a state of disrepair or do we want to help fix the wrongs that we have committed against them? These are questions that many of us would agree were one sided questions and only deserve a single answer but there is also a small group of people on this planet that have decided to exploit people and even entire countries for their own financial benefit. When we have global money in the form of cryptocurrencies there is no reason why any world government or banking institution

could interfere with our ability as a global society to fix many of the wrongs our banking system has created. When banks decide when and where money flows most of the time banks will choose to allow funds to flow to areas that may not need the financing but will return a profit to the banking system. However, a large majority of the people on this planet would choose to send their extra funds to a country, community, or even a single person in need without the added fees that banks charge to send funds on your behalf. Cryptocurrencies allow anyone anywhere with a smartphone and internet to send funds to any person or any organization anywhere in the world. In fact the rise of cryptocurrencies has even allowed many people in third and second world nations to become completely self sufficient without the interference of their local or national banking system trying to squeeze out fees and slow the entire process down for everyone involved. Banks can take days and even weeks to send funds across the world but cryptocurrencies can be sent to anyone anywhere in a matter of seconds or minutes.

Fixing the global issue of Energy Scarcity?

We as a society think that fossil fuels and renewable energies are the only way to generate sufficient energy to power the planet we live on but in reality this is simply not true. We as a society have known about alternate methods of power generation for over 100 years but we chose to hide these systems so that we could profit from the easily accessible fossil fuels buried just below our feet. We have begun to try and implement some forms of renewable energy like solar panels, wind and wave kinetic energy capture, and even geothermal forms of power and electricity generation but this is not good enough for us to succeed as a planet populated by intelligent lifeforms. We need to use the unlimited forms of energy that we have known about but suppressed to make a quick profit off of other forms of energy procurement. We must seriously look into the unlimited energy potential of zero point energy which is derived from the never-ending frequencies of matter in its most basic form at the nano and quantum scale and below. There are numerous ways to extract unlimited energy without any harm to our planet by tapping into the cosmic frequencies that currently give rise to matter, energy, and time from the nothingness of empty space. The US government and potentially other world governments work in conjunction to keep these technologies a secret so that enormous profits can be made from

alternate and sometimes dirty forms of energy extraction methods. At some point we as a global society must stand up to these people and organizations that suppress technology for profit.

Military Industrial Complex and the Global War Machine?

Fixing the Global War Machine is a tough cookie to crack but in reality the solution is very simple. The only reason why we have so many wars on this planet is because there are a select few people in this world that make an enormous profit from war itself. If we as a collective species on this planet can find a way to make wars unprofitable for everyone involved we won't have so many wars. We add taxes to gasoline and cigarettes so why not add taxes to missiles and tanks? The military industrial complex is vast and the American people were first warned of this beast by President Eisenhower in the 1950s. The military industrial complex is just a term used to describe the somewhat inappropriate relationship between weapons manufactures and the governmental lobby and elected officials that work in conjunction to ensure perpetual wars where bombs are dropped on the enemy and those bombs are replaced by expensive new weapons systems to be dropped on the enemy at a later date. There are multiple factors that work in teams to stir up conflict and then get the public to want to get involved in the conflict in order to have the US government spend over 50 percent of our tax money on weapons systems and their complimentary assets. There are so many pieces working together that even a single break in the chain could result in the end of the military industrial complex.

For example if we as a nation forced our elected officials to pay a substantial portion of their income if they voted to enter a war a majority of the elected officials would choose to forego war because it would affect them negatively from a financial point of view. Wars are expensive and if no one profited from wars we would be much less likely to have them. Another way to break this chain would be to force all military contractors to run their business as a non-profit to ensure that only the bare minimum amount of weapons are produced and the incentive to over produce weapons and their overall systems is eliminated. Another potential solution to break the military industrial complex chain would be to establish global regulations where the total monetary value spent on military expenditure was pegged to another expense for example social welfare programs. If there were global regulations that prevented any nation from

overspending on wars and underspending on social welfare we could achieve a net negative or net neutral military expenditure while increasing or maintaining beneficial social spending.

Time

What is time and why is this chapter even relevant in the whole scheme of things if the matrix is already leaking blinker fluid! Let's talk about time for a little bit and let's see how much about time you really know. When most people think about time they think of it going in one direction and maybe two directions. Most people think that time is linear and that it only moves forward at a constant rate and some even believe that time could go backwards or forwards but still just in a single direction like in the movie "Back to the Future". I'm not one of those people that believes time is linear and can only move in a single direction on a straight line that can only go forward or backward. I believe that time is only relative to the observer and that time is actually much different than we have been lead to believe. I can't see a universe that only has time in a single plane that must stay on the line without ever wavering to the left or right or maybe even up and down. I consider time to be multidirectional where it can exist going forward, backward, left, right and even up or down. In fact I believe that time is very similar to space but it can only exist in space in a linear form but without space can exist in a 3D form just like space itself. I know this gets a little bit hard to understand but let's quickly try to run a few thought experiments and see if we can save schrodinger's cat before it runs out of oxygen inside of its box.

If you look at an object in 3D space you can establish its location by denoting its position in reference to other material objects in its vicinity and even give the object a vector which is the direction and speed it's heading and you would lastly have to identify the time at which to measure the object's location and speed. With these pieces of information you could calculate where the object will be the next time to decide to take a measurement as long as the object

doesn't change its speed or direction. You will have mapped the object in reference to space and time and could always calculate its future location at any give time. You would also have the ability to take two or more measurements of the object and calculate where it was in the past before you started to measure the object in reference to space and time. Now let's throw a curve ball and see if we can still hit the pitch and get on base. If this object were to encounter a gravitational wave in between the time we were taking measurements then we would observe that the object moved at a different speed by either increasing or decreasing its velocity. However, there is also a possibility that the object didn't change its speed but the time that is usually considered linear actually changed and time itself either increased or decreased. If time slowed down the object would appear to move faster over the same distance and if time sped up then the object would appear to go slower over the same actual distance.

In some of my previous chapters I proposed that matter and time are both 3D objects and are created through vibrational frequencies applied to a cosmic container. This idea of a quantum level cosmic container allows for the theory of 3D time to exist where time and matter are created from the void of nothingness by filling a quantum level container shape with a frequency that gives rise to a specific type of matter at a specific time in reference to our universe. Not only can matter be explained as a shape arisen from a frequency, time itself can be explained as the additional dimension needed to allow matter to be manifested and destroyed at the quantum level by adding or subtracting vibrational frequency. In fact I believe that it's possible to consider time as simply matter that's in a potential state where it doesn't actually exist but has the ability to manifest. It seems highly likely that if you consider time to be 3D then you could multiply Time by itself ($T \times T$) and you would end up with matter that can be explained as matter in a specific timeline. So time is the relative factor that makes matter useful because a piece of matter in space without a time to exist in is just a piece of matter that cannot be observed. When you have a piece of matter that has a specific time to exist in you now have a way to measure the matter and reference it compared to other local objects. So time is similar to a state of matter that hasn't manifested in our reality yet but has the potential to manifest anytime and anywhere.

UFOhhNoo

What's that thing in the sky over there? It could be something that came from the University of Florida... and I like to call it a UFOhhNoo! I want to take a quick trip down memory lane where I talk a little about my college experience and maybe throw in some funny stories for good measure.

I was lucky enough to get accepted into the awesome school called the University of Florida and started attending in the fall of 2005 with the major of Aerospace-Mechanical engineering. I remember looking at the list of highest paid jobs after college graduation and the Aerospace and Nuclear Engineers seemed to have the highest pay rates at the time so that's why I chose that major in the beginning. I was also interested in planes and rockets but the reason I chose Aerospace Engineering was because of the prospect of making a bunch of money after I successfully graduated. To make a long story short I didn't graduate with a degree in Aerospace Engineering or even an engineering degree at all for that matter. I took about 7 years to finish a 4 year degree because I switched majors 4 times and had a bunch of obstacles in my way before I was able to finally graduate in 2012. I switched from Engineering to Building Construction to Liberal Arts then Accounting and eventually graduated with a Bachelors degree in Business Administration.

I did have some very interesting experiences my freshman year in college and I'll tell you about some of the best ones now. I met my eventual roommate for my sophomore year Matt because we both lived on campus and had a similar moment to the movie with Method Man and Redman titled "How High" where they have to take the ACT or SAT and are outside the testing center. "Got weed?"... "Got Blunt" is the specific scenario I was talking about in the movie but my real life conversation was something more along the lines of "I'm David!"... "I'm Matt! Wanna try my Bong?"... "Sure! Why not?". This was the beginning of a great relationship that has left me with many fond memories even until this day.

I had another friend who started his first business in 2006 at UF and his business sold marijuana via the newly emerging Facebook platform. He wasn't in business very long because he accidentally sold about \$25 worth of Mary Jane to an undercover cop on campus and got in

some trouble for that. Luckily he did end up graduating from UF and I'm pretty sure he moved out to California or Colorado or something like that.

I had another time during my freshman year were my random roommates and I were drinking heavily and all I remember is drinking a full red solo cup filled with straight Goldschlager liquor. My night ends in my memory of me drinking the cup and then going to sleep in my room and then waking up covered in sweat and maybe pee the next morning. I figured that I had just drank the cup and went to bed however another friend that lived down the hall saw me the next morning heading down the elevator because we lived on the tenth floor of our residence hall. He said something like "Bro... I'm so glad you're ok. I saw you trying to play tennis in the hallway last night around 3am.". We will never know if I actually tried to play tennis at 3am in the hallway of my dorm room but he wasn't the type of person to lie to me and it was definitely within my capabilities at the time.

Ok lets move on to the time that I had to walk for almost an hour from a party back to my friend Taylor's house and when I arrived I found the house completely filled with smoke because the 3-4 guys that had left the party early had decided to put a frozen pizza in the oven. However, none of them were able to stay awake long enough to eat the pizza and no one set a timer so the pizza was crispy, burned, and black after being left in the oven at the correct temperature of 450 degrees but for 3 times the recommended cook time. After realizing the house wasn't actually on fire I turned off the oven and opened the windows and no one else even had a clue the next morning what had happened the night before.

Let's talk about my friend Taylor and his sweet house for a moment here because it definitely deserves a second paragraph. Taylor was a friend of mine from high school and his house was usually the basecamp for all the crazy things that my friends and I did during our early college careers. We had a party at Taylor's house one time that included a keg pyramid comprised of 4-5 kegs and keg shells. This same party also included an inflatable kids pool with bikini wearing jello wrestlers and a police officer knocking at the front door as Taylor hopped his backyard fence to escape his own party. The officer at the door said "I just saw some guy climbing a keg pyramid and two girls fighting in a kids pool..." as we tried to explain that the owner of the house had left the building and it was me climbing the kegs and I won't do that anymore!

Vaynerchuk Visions

What can I say about Garyvee other than he is a great man and I can't wait to sit next to him at an event and try and return the gratitude that he has shown me recently. I've been hot on his tail like Tom Hanks was in the movie "Catch Me If You Can" while Leonardo DiCaprio was multiple steps ahead on his quest to run from society in search of an easy payday based upon being a quick magician and running from creditors in the dead of night.

I want to dedicate this chapter to Gary Vaynerchuk simply because he has been a huge inspiration on my life even though I only first heard of him in June of this year (2017) about 6 months ago when the CIA first started following me. I had a strange experience where a large whitish grey C-130 flew low and slow over my house and I was convinced the CIA was trying to extract information from the devices in my house that weren't connected to the internet. In May and June I was working on a device that I believed would change the world in a sense and then I realized that part of the device I was working on was called a "commercial killer" and that the executives at many of the major TV broadcast networks hated the device and thought anyone working on one should be punished. I read a quote online from a network executive that said something similar and a few days after that is when the large C-130 flew over my house and I decided to head back home to see my parents. Things had been a little bit strange for a few weeks and I was having the proverbial "black helicopter" keeping tabs on me on almost a daily basis and culminated with the large possibly CIA owned C-130 flying low and slow right over my house in Gainesville, FL. I drove home to see my parents for the weekend and printed up some stock certificates and also took some selective pictures at the Air Force Armament Museum in Shalimar, FL with the SR-71 Blackbird which is the second generation of the CIA's OXCART program used for high altitude reconnaissance flights.

I wanted to take a few pictures with the CIA's plane to sort of poke fun at the whole situation and without using actual words say "I see you CIA and you see ME!" Anyway, during the time I was taking pictures with the OXCART and visiting with my family I saw my first video of Garyvee and it was a promo plug for the upcoming season of "Planet of the Apps" on Apple

Music. I decided to reach out to Garyvee and a few weeks later I was on a flight to the Big Apple (NYC) and managed to catch him outside of NBC studios where he was a guest on “The View” with Gwyneth Paltrow, Jessica Alba, and Will I Am who were all mentors on the “Planet of the Apps” show. I was only able to speak to Gary for a minute or so and give him a hug and handshake before he was whisked away into a black suburban to speak on the Ryan Seacrest Show. I remember him being super nice and looked me in the eyes and said “Nice to meet you!” and right before his security team pushed him into his SUV he said “Contact D-Rock because I won’t see all your texts on my phone!” so I started communicating with David Rock, Gary’s videographer.

I was able to send DRock some of the pictures of the CIA C-130 plane that flew overhead and explain to him via email and chat that I was kind of worried about the people following me and that if anything were to happen to me please tell my story to the world. Luckily nothing has happened to me just yet and I’m able to write down most of my recent experiences and leave them in this book for the world to read someday. I also want to thank DRock and the rest of the Vayner Media crew because their inspiration and help along the way has been a huge benefit to me. I find my life feels very lonely now that I’ve been working on this invention and the friends I used to have find it difficult to believe that government agents follow me. I understand their point and it’s highly unlikely to be followed by government agents for the average person to believe but if you’re not average and potentially have ideas that could change the world it’s not out of the question for the government to want to keep tabs on you. I ask myself almost everyday “Am I crazy? Is this real?” and in my opinion a truly insane person wouldn’t be constantly questioning the facts and taking pictures to show to friends and family to say things like “This plane is real in the picture right?” and “Please help me figure out why these strange events are happening to me!”. Since these events have been happening to me for over 6 months now I’ve just started to accept them as the normal everyday anomalies that my life has attracted due to my actions and philosophy on life.

I would consider Garyvee to be the number one person I watch online now and I’m not sure if it’s because he gives great advice for numerous subjects across digital marketing and even life in general. I find key pieces of information in each of his videos and I appreciate that he gives away his content for free because I generally don’t have enough extra income to spend on entertainment and education. I completely believe that if anyone follows the examples that Gary

gives in his videos and podcasts everyone would have a chance to succeed and become as successful as Gary is over time with enough hard work. I tend to think that Gary and I would be very similar if we were to speak on the phone together because I watch how fast his mind calculates and he finishes other peoples sentences for them which is a trait I find myself doing a lot as well. After watching hours of Garyvee content I still can't remember a single piece of advice that I wouldn't agree with.

However, Garyvee and I differ on a few topics because he's always saying that everyone should build the biggest building in town without trying to tear down everyone else's building. I tend to agree with him in most cases however I have goals to build things that normal people may not accept until I show the C4 attached to some other peoples buildings. For example I want to build cars that run on water instead of gasoline and I know how to build these vehicles but there are massive companies and organizations that would do everything within their power to prevent me from achieve this goal. I also want to make cars fly by using the same technology that UFO's and UAP's use to hover and travel the stars with. Again, in the case of flying cars there are groups and organizations that don't want theses types of technologies exposed to the public and the only way I know how to bring these technologies to market is to show the world these technologies already exist but are being suppressed. I believe that when enough people understand that we don't need fossil fuel and can run cars on water and even create unlimited energy from the zero point field they will demand these technologies. During the process of exposing these technologies to the public the truth that these technologies were covered up for the profiteering of a select few companies will happen. I can't help the fact that while I try to bring these technologies to the masses we get a peak inside some of the biggest corporate buildings on Earth. When we look at the truth it seems to me that these corporate buildings suppressed technologies to make a profit and at the same time mounted C4 charges to their steel structures and tried to hide the explosive devices. They were able to keep these devices secret for a long time and now when people start to wake up they may start to lose trust in these massive corporate buildings and at some point I believe the bombs will go off just like in the movie speed. Instead of the bus going below 50mph to trigger the explosion I believe that the future will show that the public will hit a critical mass event and the trust in these companies will fall and the proverbial explosions will bring these buildings crashing down like Enron in 2000. I could be wrong maybe people will forgive these companies but maybe not and only time will tell.

We Don't Need Roads

Where we're going Marty... or Morty... We Don't Need Roads and we can even leave today and get there yesterday! Time travel Morty... It's the future of travel!

Do you remember the TV show called the Jetsons? It was about a family that lived in the future and basically lived on a space station and flew around in vehicles that had no use for the ground level roads we use today. This TV show was created and ran decades ago but for some reason we still don't have this type of travel freely available to the masses and we seem to be trying to get to this future based on outdated technology. The real flying cars or "disks" from SciFi television and real world experiences are not really just a mode of transportation. The real round flying ships that the Jetsons vehicle was based upon are actually interplanetary or inter-dimensional spaceships that have the ability to counteract the force of gravity and some can even bend the fabric of spacetime so that they can achieve inter-dimensional travel which in reality is a form of time travel. These round, triangular, and sometimes even cigar shaped crafts are able to counteract the force of gravity because they have very advanced power systems inside that are able to tap into the zero point energy field which gives rise to matter, energy and even time itself. These craft have the unique ability to create their own gravitational fields and even have the ability to counteract the gravitational fields they experience when hovering inside a planets atmosphere or traveling outside a planets atmosphere. These amazing feats of engineering marvel have the ability to lift themselves against the force of gravity and can even disappear from our dimension and reappear in another dimension. We humans, still continue to use thrust to send our ships and rockets and planes into the air by pushing fire or moving air in the opposite direction we want to go and basically pushing ourselves everywhere. This is an extremely inefficient way to try and achieve orbit or even transport ourselves laterally across the surface of the Earth via air travel. The beings that visit our planet in these round ships that are completely silent and can hover in a single spot indefinitely don't use thrust to move their craft. These

advanced being don't push their ships with thrust, they actually pull their ships with gravity. This means they simply use a directed gravitational wave to pull their craft in their direction of choice.

For example if we wanted to send up some supplies to the International Space Station we would add solid or liquid fuels to a rocket and light the engines and push the immense rocket with massive plumes of fire and thrust to move the heavy rocket to the edge of space and then slowly and carefully dock with the ISS and transport the supplies through the air locked cargo port. However, if we wanted to send up some supplies to the ISS using the same technology as our cosmic neighbors we would simply load up a round ship with supplies and then create a gravitational wave differential above our ship to immediately spring our ship to orbit in just a few seconds. The benefits of using gravity instead of thrust are numerous and can be achieved with relatively limited effort compared to the normal thrust and propulsion systems that we use today. Imagine if we were able to tie a rope to the ISS and the other end was tied to a wench mounted to our round ship. The limiting factor of the speed you could get to orbit with a setup like this is no longer dependent with the amount of thrust that can be expressed from our rocket engine. The maximum speed that can be achieved in this specific system is actually only limited by the speed the wench can wind the rope or cable. If you have a wench that was infinitely powerful and a ship that was indestructible you could technically lift your ship into orbit and meet the ISS in a matter of a few seconds. However, using conventional thrust as a propulsion system, you would only be able to lift the ship at a speed that is relative to the weight of the ship including the rocket fuels and the ability to reduce the weight of the overall system as the fuel is burned and expressed out the back of the engines. Therefore with sufficient structural integrity it would be much more efficient to pull a spacecraft into orbit instead of pushing it into orbit with conventional thrust systems. There are limits to using thrust to achieve a maximum velocity and thus atmospheric escape velocity but when you look at other potential options to get a spacecraft into orbit like directional gravitational waves the limits cease to exist.

X-Files

X-Files are some of the best files because no one wants to talk about them because they feel like they're crazy but in their heart they know they are real or at least have a thread of truth that deserves some real investigation. Have you ever seen anything that you can't explain through conventional logical means such as a ghost or spirit, or maybe a flying object that didn't resemble a conventional aircraft, or some other similar experience? I have never seen a ghost or spirit in my life or a Bigfoot aka Sasquatch in my personal life, at least not yet, but I have seen a few anomalies in the sky that I couldn't identify as a plane, helicopter, blimp, airship, comet or meteor. In fact I have experienced things I cannot explain with conventional logic on four separate occasions.

The first object that I was lucky enough to see was in 2010 around 9pm where my mother and I were walking our family dog and my mother noticed the object first. We lived along the water in Destin, FL and across the Choctawhatchee bay from our house lies Eglin AFB which is home to numerous fighter jets, helicopters, bombers and cargo aircraft. In this particular experience we were walking along the road and my mother pointed out the object to me and I would classify the object as an amber colored orb of light that seemed to be yellowish with a tint of orange. We saw this lighted orb travel over the bay at a fairly high rate of speed and was above the water but below the tree limbs from our vantage point. From our point of view the object went behind the trees that line our road and based on its trajectory we thought that the object would reappear in our field of view when it was directly over the road we live on. We expected the object to appear again at the end of the road we live on in about 20 to 30 seconds but the object never manifested again from our vantage point. Instead of the object appearing we were met with the ear piercing rumble of at least two fighter jets that must have been scrambled from the AFB across the bay. The object we had see was completely silent and was moving at the speed similar to a large passenger aircraft and was roughly 1 mile away from us. The scrambled jets seemed to make a few passed overhead and then disappeared into the blackness of night from where they first came. My mother and I never saw the lighted orb again.

The next time I saw a UFO was on February 14th, 2012 where I was driving with my girlfriend at the time south from Gainesville to Ocala, FL around 7pm where we planned to

enjoy a dinner together and as we were entering the Ocala national forest on interstate 75 the object appeared overhead. I was especially amazed at the object because it was a little brighter than the planet Venus and seemed to be moving at the same pace and direction that we were because we were traveling around 80mph and the object was in our field of view for a few minutes before I took out my phone and started recording the object. I was even able to catch on camera a helicopter catch up to the brightly lit object and come very close before making a sharp right turn and heading back off away from the object. The object seemed to disappear from our field of view as the interstate started to make a long right turn and the object seemed to weave to the left out of our field of vision. After about 5 minutes we exited the dense forest area and I spotted the object out the drives side window for a second time. However, the object was now only about 100 feet off the ground and seemed to be hovering about 30 feet above the treetops at the edge of an open field. At this point I could see that the object wasn't comprised of a single white light but actually had at least 3 lights and maybe even 4 or more. The object had a single red light that seemed to be much dimmer than the other 2-3 white lights as the object continued to hover at the edge of the tree line next to an open field. We passed the object going around 70mph and never saw the hovering craft again.

The next time I saw an object in the sky that I cannot explain was in the summer of 2016 with a friend of mine, Judson, while we were talking about life in my driveway in NW Gainesville, FL. We were having the usual conversation about work and life and whatnot when out of nowhere a massive and ultra bright object that resembled a meteor flashed over our heads and heading into our field of view. We both watched in amazement as the object appeared overhead and rushed past us directly in front of us and made no sound whatsoever. This object was a green ball of light that was trailed by a white and orange tail that looked to be on fire and made of flames. This object could be considered the average "green fireball" and was awesome to see in real life. I believe that the object was roughly 10,000 feet in altitude and was able to rush from our 6 to our 12, meaning it came from behind and rushed past us directly in our forward field of view. The object was extremely fast and we only had maybe 2-3 seconds to watch the object before it was past the trees in front of us and finally out of our field of view. This object was low in comparison to the commercial flights that traverse over my house each day and was low enough to collide with the Shands CAIR Medical transport helicopter that I

often catch flying overhead but luckily the Shands helicopter wasn't in the area at the time my friend and I were lucky enough to witness this awesome event.

I have also seen another orb or two since the green fireball event but these sightings were only for a few seconds and my vantage point for these sightings wasn't good enough to completely rule out your average low flying helicopter or personal aircraft. Although I fully believe these orb like objects may very well have been an other worldly vehicle it's technically possible that they were a personal aircraft that was flying with the center landing gear light on and I wasn't able to see the green and red flashing navigation lights that I usually use to tell what type of aircraft I'm looking at. So in order to err on the side of caution I'm just going to say that I saw two more orbs but let's cut that in half and agree that one of the two if not both were another version of the orb I clearly witnessed with my mother and dog in 2010.

Yellow Swan Event Time

When everyone comes together for the greater good of humanity we will be able to achieve the "Yellow Swan Event" which is comprised of a declaration to end wars for profit and institute new rules of society where the playing field is level and everyone can rise to their kingdom with hard work over time. In order to achieve a full scale Yellow Swan Event we as a human race must stand up to the powers that exercise control over us and espouse our declaration that they no longer have our destiny in their hands.

This means that everyone everywhere must make a conscious decision to remove their investments from companies that profit from wars and even the banking system that is an integral part of the military industrial complex that we are in the midst of today. If you profit by keeping your money in stocks that harm the environment just so that you can enjoy a dividend payment each month or quarter you are almost as guilty as the people who run the companies and make decisions to destroy our Earth's environment in order to realize a monetary gain in the form of

profits and paid out as stock options and dividend payments. We must all decide as a society if our dividend payments are worth the destruction of our environment and not just in our lifetime but also in our children's lifetime and our grandchildren's lifetimes. Corporations aren't real and when they die, no one ever goes to their funeral (Enron). The best solution to achieve a New World where everyone has a fair playing field is to take the short term loss of a few dividend payments and invest that same value into a green company or into a local organization that can be used to create social value and even provide some sort of monetary return on your investment. This means that if you're young or you're retired and live on payments from an oil lease on your property try to trade that payment for one based on solar. If you're one of the first people to see this shift in society and take advantage of this new opportunity, you won't be the last person stuck with a unprofitable oil land lease. At some point we aren't going to need fossil fuel and if that's where you make your money it's best to try and get into something that actually helps humanity instead of harms it. I plan on building the machines that will make the fossil industry obsolete and you don't want to be stuck holding an asset that no one will want to buy in the future. The good news is solar and renewable energies are a great investment for today but I also plan to change the overall economics of these industries at some point as well. Once, we decide to cut off all dependance on fossil fuels I believe that we will be able to supply the entire worlds energy needs with solar and renewable energy and eventually move on to even more sustainable energies by tapping into the zero point field and using the same energy that our cosmic neighbors use to travel in their round interplanetary ships. I know how to build these devices and vehicles and I'm going to spend my entire life bringing these forms of technology to everyone on this planet.

Everyone needs to wake up and realize that you've been lied to for most of your lives by the governments and the world leaders. When we as a society hit the critical mass event where a majority of the population knows the truth about how this world operates we are going to have a revolution. I can't tell you now if this revolution is going to be peaceful or not but I can tell you that there will be a revolution and that the people will demand to know more of the truth. The people will be angry that the lies of this planet have led to the near destructions of our world over the last few centuries. People will see the truth and realize that they don't have to live on a dirty planet anymore and that we have the ability to stop killing our planet for a profit and we can decide to make the world better where everyone wins. One day people will see that the entire planet is filled with lies and there are a small subgroup of people here who make immense profits

off the back of others and even the planet itself. After a majority of people are awake and have come to realize our planet has the potential to be much better after we kick out the free loaders that profit from all of our hard work we will have achieved an entirely new society based in science, trust, merit, and truth. Each person that works hard and helps others or the environment will be rewarded with a happy and abundant life. Anyone that profits at the expense of others will be known and cast out and punished so that our new society can thrive with like minded people and beings of love and light. The evil that has a stranglehold on our planet can only exist in darkness and behind closed doors and the future is bright because many of us know what is truly happening on this planet and the evil deeds will continue to be exposed until no more exist. Everyone will know how things operate and the secrets of yesterday will be gone and in their place will be a new society based upon truth and honesty that can only exist out in the open and in the light. When the evil of darkness is shone with the light of truth the darkness will die off and the light of truth will be available for everyone to benefit from.

Zed's Dead

What happened to Zed? Well honey "Zed's Dead" and we don't have to worry about that guy anymore. Let's have a great evening and learn to enjoy what we have now because the now is all that matters and the future is always in our dreams.

I believe that the world we live in is only an illusion of the constructs that we have allowed ourselves to be limited by. What if we all decided as a global partnership to say "Enough is Enough" and we started making our own rules instead of abiding by the rules that the first people to instill the rule of law designated for us? Is it wrong to think that just because there are rules we have to abide by all of them? What if the rules of society were constructed not just to keep us safe but were also created to limit our understanding of the universe and its multiple

dimensions? Can a single person decide to make their own rules and live by them as long as no harm comes to their cosmic neighbors?

I want to be able to enjoy my life and experience the wonders of the cosmos and I don't care whose rules I have to break in order to get there. Now I don't plan on harming anyone else in my pursuit to experience a cosmic life but I also won't be help back because some people are scared to learn the truth about this holographic or fractal universe that we currently live inside of. If you don't like the reality that I live in you can just fractal out to your own world and universe and all of your friends that you want to experience your own work with will come with you. I exist in my own world and you can join me here in harmony or you can create your own world and experience it yourself. I want to cause no harm to anyone in my pursuit of eternal happiness and exploration but I also won't be limited by you. I come in peace and leave in persuasion with the hopes that you will find your own truths about the universe and I wish you happiness in your own pursuit of cosmic harmony inside your own fractal matrix that we call life. Godspeed my dear friends I wish you enormous success and love during your journey and I hope to meet you again at the end with 3000 Flurbos at the nearest "Blips and Chitz". Enjoy your life and may the Force be with you in all your endeavors to find the happiness you seek in your heart!

Departing Words

If you want to be able to place your building in the most efficient use of space you will plan to face your windows a certain way to capture sunlight at a specific time of day or time of the year. This is why a great architect can not only see the structure in both the 2D plane and 3D maps or computer generated drawings he or she can also look at the direction and placement of the building and its relationship to the sun during specific times of the year.

Hello Marty McFly... I love those sweet shoes bro! Let's talk about shoes or something that we can all relate to and try to come back inside the matrix and get out of the real world that exists in my literary Alice in Wonderland universe of words, syntax, style, creative insanity, imagination and add a touch of character assassination.

THE END
